

# **pgmoneta**

User Guide

## Contents

<b>1</b>	<b>Introduction</b>	<b>9</b>
1.1	Features . . . . .	9
1.2	Platforms . . . . .	10
<b>2</b>	<b>Installation</b>	<b>11</b>
2.1	Fedora . . . . .	11
2.2	RHEL 9 / RockyLinux 9 . . . . .	11
2.3	Compiling the source . . . . .	11
2.3.1	RHEL / RockyLinux . . . . .	12
2.3.2	FreeBSD . . . . .	13
2.3.3	Build . . . . .	13
2.4	Compiling the documentation . . . . .	14
2.4.1	Build . . . . .	14
2.5	Extension installation . . . . .	15
2.5.1	Install pgmoneta_ext . . . . .	15
2.5.2	Verify success . . . . .	15
2.5.3	Granting SUPERUSER Privileges . . . . .	16
<b>3</b>	<b>Quick start</b>	<b>17</b>
3.1	Configuration . . . . .	18
3.2	Running . . . . .	19
3.3	Run-time administration . . . . .	20
3.4	Administration . . . . .	22
3.5	Next Steps . . . . .	22
<b>4</b>	<b>Configuration</b>	<b>24</b>
4.1	pgmoneta . . . . .	24
4.2	Server section . . . . .	38
4.2.1	extra parameter . . . . .	41
4.3	pgmoneta_users configuration . . . . .	41
4.4	pgmoneta_admins configuration . . . . .	41
<b>5</b>	<b>pgmoneta_walinfo configuration</b>	<b>42</b>
5.1	[pgmoneta_walinfo] . . . . .	42
5.2	Server section . . . . .	42

<b>6</b>	<b>Tutorials</b>	<b>43</b>
6.1	Install pgmoneta . . . . .	43
6.1.1	Preface . . . . .	43
6.1.2	Initialize cluster . . . . .	43
6.1.3	Remove default access . . . . .	43
6.1.4	Add access for users and a database . . . . .	44
6.1.5	Make sure that replication level is set . . . . .	44
6.1.6	Start PostgreSQL . . . . .	44
6.1.7	Add users and a database . . . . .	44
6.1.8	Add Write-Ahead Log (WAL) replication slot . . . . .	45
6.1.9	Verify access . . . . .	45
6.1.10	Add pgmoneta user . . . . .	45
6.1.11	Create pgmoneta configuration . . . . .	45
6.1.12	Create base directory . . . . .	47
6.1.13	Start pgmoneta . . . . .	47
6.1.14	Create a backup . . . . .	47
6.1.15	View backup . . . . .	47
6.1.16	Shell completion . . . . .	47
6.2	Remote administration for pgmoneta . . . . .	48
6.2.1	Preface . . . . .	48
6.2.2	Change the pgmoneta configuration . . . . .	48
6.2.3	Add pgmoneta admin . . . . .	49
6.2.4	Restart pgmoneta . . . . .	49
6.2.5	Connect via remote administration interface . . . . .	49
6.2.6	Using Transport Level Security for access . . . . .	49
6.3	Prometheus metrics for pgmoneta . . . . .	50
6.3.1	Preface . . . . .	50
6.3.2	Change the pgmoneta configuration . . . . .	50
6.3.3	Restart pgmoneta . . . . .	50
6.3.4	Get Prometheus metrics . . . . .	51
6.3.5	TLS support . . . . .	51
6.4	Backup and restore . . . . .	53
6.4.1	Preface . . . . .	53
6.4.2	Backup . . . . .	53
6.4.3	List backups . . . . .	53
6.4.4	Restore . . . . .	54
6.5	Verify . . . . .	54
6.5.1	Preface . . . . .	54

6.5.2	Verify . . . . .	54
6.6	Archive . . . . .	55
6.6.1	Preface . . . . .	55
6.6.2	Creating an archive . . . . .	55
6.7	Delete a backup . . . . .	55
6.7.1	Preface . . . . .	55
6.7.2	Delete the oldest backup . . . . .	55
6.8	Encryption and Decryption . . . . .	56
6.8.1	Preface . . . . .	56
6.8.2	Enable Encryption and Decryption in pgmoneta workflow . . . . .	56
6.8.3	Encryption and Decryption Commands . . . . .	56
6.9	Retention Policy . . . . .	56
6.9.1	Preface . . . . .	57
6.9.2	Retention Setup . . . . .	57
6.9.3	Retention Validation Rule . . . . .	57
6.10	Retention check . . . . .	57

## 1 Introduction

**pgmoneta** is a backup / restore solution for PostgreSQL.

Ideally, you would not need to do backups and disaster recovery, but that isn't how the real World works.

Possible scenarios that could happen

- Data corruption
- System failure
- Human error
- Natural disaster

and then it is up to the database administrator to get the database system back on-line, and to the correct recovery point.

Two key factors are

- Recovery Point Objective (RPO): Maximum targeted period in which data might be lost from an IT service due to a major incident
- Recovery Time Objective (RTO): The targeted duration of time and a service level within which a business process must be restored after a disaster (or disruption) in order to avoid unacceptable consequences associated with a break in business continuity

You would like to have both of these as close to zero as possible, since RPO of 0 means that you won't lose data, and RTO of 0 means that your system recovers at once. However, that is easier said than done.

**pgmoneta** is focused on having features that will allow database systems to get as close to these goals as possible such that high availability of 99.99% or more can be implemented, and monitored through standard tools.

**pgmoneta** is named after the Roman Goddess of Memory.

### 1.1 Features

- Full backup
- Restore
- Compression (gzip, zstd, lz4, bzip2)
- AES encryption support
- Symlink support
- WAL shipping support

- Hot standby
- Prometheus support
- Remote management
- Offline detection
- Transport Layer Security (TLS) v1.2+ support
- Daemon mode
- User vault

## **1.2 Platforms**

The supported platforms are

- Fedora 38+
- RHEL 9
- RockyLinux 9
- FreeBSD
- OpenBSD

## 2 Installation

### 2.1 Fedora

You need to add the PostgreSQL YUM repository, for example for Fedora 40

```
dnf install -y https://download.postgresql.org/pub/repos/yum/reporpms/F-40-x86_64/pgdg-fedora-repo-latest.noarch.rpm
```

and do the install via

```
dnf install -y pgmoneta
```

Additional information

- PostgreSQL YUM
- Linux downloads

### 2.2 RHEL 9 / RockyLinux 9

#### x86\_64

```
dnf install -y https://dl.fedoraproject.org/pub/epel/epel-release-latest-9.noarch.rpm
dnf install -y https://download.postgresql.org/pub/repos/yum/reporpms/EL-9-x86_64/pgdg-redhat-repo-latest.noarch.rpm
```

#### aarch64

```
dnf install -y https://dl.fedoraproject.org/pub/epel/epel-release-latest-9.noarch.rpm
dnf install -y https://download.postgresql.org/pub/repos/yum/reporpms/EL-9-aarch64/pgdg-redhat-repo-latest.noarch.rpm
```

and do the install via

```
dnf install -y pgmoneta
```

### 2.3 Compiling the source

We recommend using Fedora to test and run **pgmoneta**, but other Linux systems, FreeBSD and MacOS are also supported.

**pgmoneta** requires

- clang
- cmake
- make
- libev
- OpenSSL
- zlib
- zstd
- lz4
- bzip2
- systemd
- rst2man
- libssh
- libarchive

```
dnf install git gcc clang clang-analyzer cmake make libev libev-devel \
    openssl openssl-devel \
    systemd systemd-devel zlib zlib-devel \
    libzstd libzstd-devel \
    lz4 lz4-devel libssh libssh-devel \
    python3-docutils libatomic \
    bzip2 bzip2-devel \
    libarchive libarchive-devel
```

Alternative gcc can be used.

### 2.3.1 RHEL / RockyLinux

On RHEL / Rocky, before you install the required packages some additional repositories need to be enabled or installed first.

First you need to install the subscription-manager

```
dnf install subscription-manager
```

It is ok to disregard the registration and subscription warning.

Otherwise, if you have a Red Hat corporate account (you need to specify the company/organization name in your account), you can register using

```
subscription-manager register --username <your-account-email-or-login> --
    password <your-password> --auto-attach
```

Then install the EPEL repository,

```
dnf install epel-release
```

Then to enable powertools

```
dnf config-manager --set-enabled codeready-builder-for-rhel-9-rhui-rpms
dnf config-manager --set-enabled crb
dnf install https://dl.fedoraproject.org/pub/epel/epel-release-latest-9.
noarch.rpm
```

Then use the `dnf` command for **pgmoneta** to install the required packages.

### 2.3.2 FreeBSD

On FreeBSD, `pkg` is used instead of `dnf` or `yum`.

Use `pkg install <package name>` to install the following packages

```
git gcc cmake libev openssl libssh zlib-ng zstd liblz4 bzip2 \
py39-docutils libarchive
```

### 2.3.3 Build

**2.3.3.1 Release build** The following commands will install **pgmoneta** in the `/usr/local` hierarchy.

```
git clone https://github.com/pgmoneta/pgmoneta.git
cd pgmoneta
mkdir build
cd build
cmake -DCMAKE_INSTALL_PREFIX=/usr/local ..
make
sudo make install
```

See RPM for how to build a RPM of **pgmoneta**.

**2.3.3.2 Debug build** The following commands will create a `DEBUG` version of **pgmoneta**.

```
git clone https://github.com/pgmoneta/pgmoneta.git
cd pgmoneta
mkdir build
cd build
cmake -DCMAKE_C_COMPILER=clang -DCMAKE_BUILD_TYPE=Debug ..
make
```

You can do

```
cmake -DCMAKE_C_COMPILER=clang -DCMAKE_BUILD_TYPE=Debug -DCMAKE_C_FLAGS="-DCORE_DEBUG" ..
```

in order to get information from the core libraries too.

## 2.4 Compiling the documentation

**pgmoneta**'s documentation requires

- pandoc
- texlive

```
dnf install pandoc texlive-scheme-basic \
    'tex(footnote.sty)' 'tex(footnotebackref.sty)' \
    'tex(pagecolor.sty)' 'tex(hardwrap.sty)' \
    'tex(mdframed.sty)' 'tex(sourcesanspro.sty)' \
    'tex(lylenc.def)' 'tex(sourcecodepro.sty)' \
    'tex(titling.sty)' 'tex(csquotes.sty)' \
    'tex(zref-abspace.sty)' 'tex(needspace.sty)' \
    'tex(selnolig.sty)'
```

You will need the `Eisvogel` template as well which you can install through

```
wget https://github.com/Wandmalfarbe/pandoc-latex-template/releases/
download/v3.2.0/Eisvogel-3.2.0.tar.gz
tar -xzf Eisvogel-3.2.0.tar.gz
mkdir -p $HOME/.local/share/pandoc/templates
mv Eisvogel-3.2.0/eisvogel.latex $HOME/.local/share/pandoc/templates
```

where `$HOME` is your home directory.

**2.4.0.1 Generate API guide** This process is optional. If you choose not to generate the API HTML files, you can opt out of downloading these dependencies, and the process will automatically skip the generation.

Download dependencies

```
dnf install graphviz doxygen
```

### 2.4.1 Build

These packages will be detected during `cmake` and built as part of the main build.

## 2.5 Extension installation

When you configure the `extra` parameter in the server section of `pgmoneta.conf`, it requires the server side to have the `pgmoneta_ext` extension installed to make it work.

The following instructions can help you easily install `pgmoneta_ext`. If you encounter any problems, please refer to the more detailed instructions in the DEVELOPERS documentation.

### 2.5.1 Install `pgmoneta_ext`

After you have successfully installed `pgmoneta`, the following commands will help you install `pgmoneta_ext`:

```
dnf install -y pgmoneta_ext
```

You need to add the `pgmoneta_ext` library for PostgreSQL in `postgresql.conf` as well:

```
shared_preload_libraries = 'pgmoneta_ext'
```

And remember to restart PostgreSQL to make it work.

### 2.5.2 Verify success

You can use the `postgres` role to test.

1. Log into PostgreSQL

```
psql
```

2. Create a new test database

```
CREATE DATABASE testdb;
```

3. Enter the database

```
\c testdb
```

4. Follow the SQL commands below to check the function

```
DROP EXTENSION IF EXISTS pgmoneta_ext;  
CREATE EXTENSION pgmoneta_ext;  
SELECT pgmoneta_ext_version();
```

You should see

```
pgmoneta_ext_version
-----
0.1.0
(1 row)
```

### 2.5.3 Granting SUPERUSER Privileges

Some functions in `pgmoneta_ext` require `SUPERUSER` privileges. To enable these, grant the `repl` role superuser privileges using the command below. **Please proceed with caution:** granting superuser privileges bypasses all permission checks, allowing unrestricted access to the database, which can pose security risks. We are committed to enhancing privilege security in future updates.

```
ALTER ROLE repl WITH SUPERUSER;
```

To revoke superuser privileges from the `repl` role, use the following command:

```
ALTER ROLE repl WITH NOSUPERUSER;
```

### 3 Quick start

Make sure that **pgmoneta** is installed and in your path by using `pgmoneta -?`. You should see

```
pgmoneta 0.18.0
Backup / restore solution for PostgreSQL

Usage:
pgmoneta [ -c CONFIG_FILE ] [ -u USERS_FILE ] [ -d ]

Options:
-c, --config CONFIG_FILE          Set the path to the
pgmoneta.conf file
-h, --host HOST                   Set the host name
-p, --port PORT                   Set the port number
-U, --user USERNAME               Set the user name
-P, --password PASSWORD           Set the password
-L, --logfile FILE                 Set the log file
-v, --verbose                      Output text string of
result
-V, --version                      Display version
information
-F, --format text|json|raw         Set the output format
-C, --compress none|gz|zstd|lz4|bz2 Compress the wire
protocol
-E, --encrypt none|aes|aes256|aes192|aes128 Encrypt the wire
protocol
-?, --help                        Display help

Commands:
annotate                          Annotate a backup with comments
archive                          Archive a backup from a server
backup                           Backup a server
clear <what>                      Clear data, with:
- 'prometheus' to reset the Prometheus
statistics
compress                         Compress a file using configured method
conf <action>                    Manage the configuration, with one of
subcommands:
- 'get' to obtain information about a runtime
configuration value
conf get <parameter_name>
- 'ls' to print the configurations used
- 'reload' to reload the configuration
- 'set' to modify a configuration value;
conf set <parameter_name> <parameter_value>;
decompress                       Decompress a file using configured method
decrypt                          Decrypt a file using master-key
delete                           Delete a backup from a server
encrypt                          Encrypt a file using master-key
```

expunge	Expunge a backup from a server
info	Information about a backup
list-backup	List the backups <b>for</b> a server
mode	Switch the mode <b>for</b> a server
ping	Check <b>if</b> pgmoneta is alive
restore	Restore a backup from a server
retain	Retain a backup from a server
shutdown	Shutdown pgmoneta
status [details]	Status of pgmoneta, with optional details
verify	Verify a backup from a server

pgmoneta: <https://pgmoneta.github.io/>  
Report bugs: <https://github.com/pgmoneta/pgmoneta/issues>

If you encounter any issues following the above steps, you can refer to the **Installation** chapter to see how to install or compile pgmoneta on your system.

### 3.1 Configuration

Lets create a simple configuration file called `pgmoneta.conf` with the content

```
[pgmoneta]
host = *
metrics = 5001

base_dir = /home/pgmoneta

compression = zstd

retention = 7

log_type = file
log_level = info
log_path = /tmp/pgmoneta.log

unix_socket_dir = /tmp/

[primary]
host = localhost
port = 5432
user = repl
wal_slot = repl
```

In our main section called `[pgmoneta]` we setup **pgmoneta** to listen on all network addresses. We will enable Prometheus metrics on port 5001 and have the backups live in the `/home/pgmoneta` directory. All backups are being compressed with `zstd` and kept for 7 days. Logging will be performed at `info` level and put in a file called `/tmp/pgmoneta.log`. Last we specify the location of the

`unix_socket_dir` used for management operations and the path for the PostgreSQL command line tools.

Next we create a section called `[primary]` which has the information about our PostgreSQL instance. In this case it is running on `localhost` on port 5432 and we will use the `repl` user account to connect, and the Write+Ahead slot will be named `repl` as well.

The `repl` user must have the `REPLICATION` role and have access to the `postgres` database, so for example

```
CREATE ROLE repl WITH LOGIN REPLICATION PASSWORD 'secretpassword';
```

and in `pg_hba.conf`

local	postgres	repl		scram-sha-256
host	postgres	repl	127.0.0.1/32	scram-sha-256
host	postgres	repl	:::1/128	scram-sha-256
host	replication	repl	127.0.0.1/32	scram-sha-256
host	replication	repl	:::1/128	scram-sha-256

The authentication type should be based on `postgresql.conf`'s `password_encryption` value.

Then, create a physical replication slot that will be used for Write-Ahead Log streaming, like

```
SELECT pg_create_physical_replication_slot('repl', true, false);
```

Alternatively, configure automatically slot creation by adding `create_slot = yes` to `[pgmoneta]` or corresponding server section.

We will need a user vault for the `repl` account, so the following commands will add a master key, and the `repl` password. The master key should be longer than 8 characters.

```
pgmoneta-admin master-key  
pgmoneta-admin -f pgmoneta_users.conf user add
```

For scripted use, the master key and user password can be provided using the `PGMONETA_PASSWORD` environment variable.

We are now ready to run **pgmoneta**.

See the **Configuration** chapter for all configuration options.

## 3.2 Running

We will run **pgmoneta** using the command

```
pgmoneta -c pgmoneta.conf -u pgmoneta_users.conf
```

If this doesn't give an error, then we are ready to do backups.

**pgmoneta** is stopped by pressing Ctrl-C (^C) in the console where you started it, or by sending the **SIGTERM** signal to the process using `kill <pid>`.

### 3.3 Run-time administration

**pgmoneta** has a run-time administration tool called `pgmoneta-cli`.

You can see the commands it supports by using `pgmoneta-cli -?` which will give

```
pgmoneta 0.18.0
Backup / restore solution for PostgreSQL

Usage:
pgmoneta [ -c CONFIG_FILE ] [ -u USERS_FILE ] [ -d ]

Options:
-c, --config CONFIG_FILE      Set the path to the
                               pgmoneta.conf file
-h, --host HOST               Set the host name
-p, --port PORT               Set the port number
-U, --user USERNAME          Set the user name
-P, --password PASSWORD      Set the password
-L, --logfile FILE            Set the log file
-v, --verbose                 Output text string of
                               result
-V, --version                 Display version
                               information
-F, --format text|json|raw    Set the output format
-C, --compress none|gz|zstd|lz4|bz2
                               Compress the wire
                               protocol
-E, --encrypt none|aes|aes256|aes192|aes128
                               Encrypt the wire
                               protocol
-?, --help                    Display help

Commands:
annotate                      Annotate a backup with comments
archive                       Archive a backup from a server
backup                        Backup a server
clear <what>                  Clear data, with:
                               - 'prometheus' to reset the Prometheus
                               statistics
compress                      Compress a file using configured method
conf <action>                 Manage the configuration, with one of
                               subcommands:
```

	<ul style="list-style-type: none"><li>- 'get' to obtain information about a runtime configuration value</li><li>- 'ls' to print the configurations used</li><li>- 'reload' to reload the configuration</li><li>- 'set' to modify a configuration value;</li></ul>
decompress	conf get <parameter_name> Decompress a file using configured method
decrypt	conf set <parameter_name> <parameter_value>; Decrypt a file using master-key
delete	Delete a backup from a server
encrypt	Encrypt a file using master-key
expunge	Expunge a backup from a server
info	Information about a backup
list-backup	List the backups <b>for</b> a server
mode	Switch the mode <b>for</b> a server
ping	Check <b>if</b> pgmoneta is alive
restore	Restore a backup from a server
retain	Retain a backup from a server
shutdown	Shutdown pgmoneta
status [details]	Status of pgmoneta, with optional details
verify	Verify a backup from a server

pgmoneta: <https://pgmoneta.github.io/>

Report bugs: <https://github.com/pgmoneta/pgmoneta/issues>

This tool can be used on the machine running **pgmoneta** to do a backup like

```
pgmoneta-cli -c pgmoneta.conf backup primary
```

A restore would be

```
pgmoneta-cli -c pgmoneta.conf restore primary <timestamp> /path/to/restore
```

To shutdown pgmoneta you would use

```
pgmoneta-cli -c pgmoneta.conf shutdown
```

Check the outcome of the operations by verifying the exit code, like

```
echo $?
```

or by using the `-v` flag.

If pgmoneta has both Transport Layer Security (TLS) and `management` enabled then `pgmoneta-cli` can connect with TLS using the files `~/.pgmoneta/pgmoneta.key` (must be 0600 permission), `~/.pgmoneta/pgmoneta.crt` and `~/.pgmoneta/root.crt`.

### 3.4 Administration

**pgmoneta** has an administration tool called `pgmoneta-admin`, which is used to control user registration with **pgmoneta**.

You can see the commands it supports by using `pgmoneta-admin -?` which will give

```
pgmoneta-admin 0.18.0
Administration utility for pgmoneta

Usage:
pgmoneta-admin [ -f FILE ] [ COMMAND ]

Options:
-f, --file FILE          Set the path to a user file
-U, --user USER         Set the user name
-P, --password PASSWORD Set the password for the user
-g, --generate           Generate a password
-l, --length             Password length
-V, --version            Display version information
-?, --help              Display help

Commands:
master-key              Create or update the master key
user <subcommand>      Manage a specific user, where <subcommand> can
    be
                        - add   to add a new user
                        - del   to remove an existing user
                        - edit  to change the password for an existing
                             user
                        - ls    to list all available users
```

In order to set the master key for all users you can use

```
pgmoneta-admin -g master-key
```

The master key must be at least 8 characters.

Then use the other commands to add, update, remove or list the current user names, f.ex.

```
pgmoneta-admin -f pgmoneta_users.conf user add
```

### 3.5 Next Steps

Next steps in improving pgmoneta's configuration could be

- Update `pgmoneta.conf` with the required settings for your system
- Enable Transport Layer Security v1.2+ (TLS) for administrator access

See Configuration for more information on these subjects.

## 4 Configuration

The configuration is loaded from either the path specified by the `-c` flag or `/etc/pgmoneta/pgmoneta.conf`.

The configuration of **pgmoneta** is split into sections using the `[` and `]` characters.

The main section, called `[pgmoneta]`, is where you configure the overall properties of **pgmoneta**.

Other sections doesn't have any requirements to their naming so you can give them meaningful names like `[primary]` for the primary PostgreSQL instance.

All properties are in the format `key = value`.

The characters `#` and `;` can be used for comments; must be the first character on the line.

The `Bool` data type supports the following values: `on`, `yes`, `1`, `true`, `off`, `no`, `0` and `false`.

See a sample configuration for running **pgmoneta** on `localhost`.

### 4.1 pgmoneta

Property	Default	Unit	Required	Description
host		String	Yes	The bind address for pgmoneta
unix_socket_dir		String	Yes	The Unix Domain Socket location
base_dir		String	Yes	The base directory for the backup
metrics	0	Int	No	The metrics port (disable = 0)

Property	Default	Unit	Required	Description
metrics_cache_max_age	0	String	No	The time to keep a Prometheus (metrics) response in cache. If this value is specified without units, it is taken as seconds. Setting this parameter to 0 disables caching. It supports the following units as suffixes: 'S' for seconds (default), 'M' for minutes, 'H' for hours, 'D' for days, and 'W' for weeks.

Property	Default	Unit	Required	Description
metrics_cache_max_size	256k	String	No	The maximum amount of data to keep in cache when serving Prometheus responses. Changes require restart. This parameter determines the size of memory allocated for the cache even if <code>metrics_cache_max_age</code> or <code>metrics</code> are disabled. Its value, however, is taken into account only if <code>metrics_cache_max_age</code> is set to a non-zero value. Supports suffixes: 'B' (bytes), the default if omitted, 'K' or 'KB' (kilobytes), 'M' or 'MB' (megabytes), 'G' or 'GB' (gigabytes).
management	0	Int	No	The remote management port (disable = 0)
compression	zstd	String	No	The compression type (none, gzip, client-gzip, server-gzip, zstd, client-zstd, server-zstd, lz4, client-lz4, server-lz4, bzip2, client-bzip2)

Property	Default	Unit	Required	Description
compression_level	3	Int	No	The compression level
workers	0	Int	No	The number of workers that each process can use for its work. Use 0 to disable. Maximum is CPU count
workspace	/tmp/pgmoneta/ workspace/	String	No	The directory for the workspace that incremental backup can use for its work
storage_engine	local	String	No	The storage engine type (local, ssh, s3, azure)

Property	Default	Unit	Required	Description
encryption	none	String	No	The encryption mode for encrypt wal and data <code>none</code> : No encryption <code>aes</code> or <code>aes-256</code> or <code>aes-256-cbc</code> : AES CBC (Cipher Block Chaining) mode with 256 bit key length <code>aes-192</code> or <code>aes-192-cbc</code> : AES CBC mode with 192 bit key length <code>aes-128</code> or <code>aes-128-cbc</code> : AES CBC mode with 128 bit key length <code>aes-256-ctr</code> : AES CTR (Counter) mode with 256 bit key length <code>aes-192-ctr</code> : AES CTR mode with 192 bit key length <code>aes-128-ctr</code> : AES CTR mode with 128 bit key length
create_slot	no	Bool	No	Create a replication slot for all server. Valid values are: yes, no
ssh_hostname		String	Yes	Defines the hostname of the remote system for connection

Property	Default	Unit	Required	Description
ssh_username		String	Yes	Defines the username of the remote system for connection
ssh_base_dir		String	Yes	The base directory for the remote backup
ssh_ciphers	aes-256-ctr, aes-192-ctr, aes-128-ctr	String	No	The supported ciphers for communication. <a href="#">aes</a> or <a href="#">aes-256</a> or <a href="#">aes-256-cbc</a> : AES CBC (Cipher Block Chaining) mode with 256 bit key length <a href="#">aes-192</a> or <a href="#">aes-192-cbc</a> : AES CBC mode with 192 bit key length <a href="#">aes-128</a> or <a href="#">aes-128-cbc</a> : AES CBC mode with 128 bit key length <a href="#">aes-256-ctr</a> : AES CTR (Counter) mode with 256 bit key length <a href="#">aes-192-ctr</a> : AES CTR mode with 192 bit key length <a href="#">aes-128-ctr</a> : AES CTR mode with 128 bit key length. Otherwise verbatim
s3_aws_region		String	Yes	The AWS region

Property	Default	Unit	Required	Description
s3_access_key_id		String	Yes	The IAM access key ID
s3_secret_access_key		String	Yes	The IAM secret access key
s3_bucket		String	Yes	The AWS S3 bucket name
s3_base_dir		String	Yes	The base directory for the S3 bucket
azure_storage_account		String	Yes	The Azure storage account name
azure_container		String	Yes	The Azure container name
azure_shared_key		String	Yes	The Azure storage account key
azure_base_dir		String	Yes	The base directory for the Azure container
retention	7, -, -, -	Array	No	The retention time in days, weeks, months, years
retention_interval	300	Int	No	The retention check interval
log_type	console	String	No	The logging type (console, file, syslog)

Property	Default	Unit	Required	Description
log_level	info	String	No	The logging level, any of the (case insensitive) strings <a href="#">FATAL</a> , <a href="#">ERROR</a> , <a href="#">WARN</a> , <a href="#">INFO</a> and <a href="#">DEBUG</a> (that can be more specific as <a href="#">DEBUG1</a> thru <a href="#">DEBUG5</a> ). Debug level greater than 5 will be set to <a href="#">DEBUG5</a> . Not recognized values will make the log_level be <a href="#">INFO</a>
log_path	pgmoneta.	String	No	The log file location. Can be a strftime(3) compatible string.
log_rotation_age	0	String	No	The time after which log file rotation is triggered. If this value is specified without units, it is taken as seconds. Setting this parameter to 0 disables log rotation based on time. It supports the following units as suffixes: 'S' for seconds (default), 'M' for minutes, 'H' for hours, 'D' for days, and 'W' for weeks.

Property	Default	Unit	Required	Description
log_rotation_size	0	String	No	The size of the log file that will trigger a log rotation. Supports suffixes: 'B' (bytes), the default if omitted, 'K' or 'KB' (kilobytes), 'M' or 'MB' (megabytes), 'G' or 'GB' (gigabytes). A value of 0 (with or without suffix) disables.
log_line_prefix	%Y-%m-%d %H:%M:%S	String	No	A strftime(3) compatible string to use as prefix for every log line. Must be quoted if contains spaces.
log_mode	append	String	No	Append to or create the log file (append, create)

Property	Default	Unit	Required	Description
blocking_timeout	30	String	No	The number of seconds the process will be blocking for a connection. If this value is specified without units, it is taken as seconds. Setting this parameter to 0 disables it. It supports the following units as suffixes: 'S' for seconds (default), 'M' for minutes, 'H' for hours, 'D' for days, and 'W' for weeks.
tls	off	Bool	No	Enable Transport Layer Security (TLS)
tls_cert_file		String	No	Certificate file for TLS. This file must be owned by either the user running pgmoneta or root.
tls_key_file		String	No	Private key file for TLS. This file must be owned by either the user running pgmoneta or root. Additionally permissions must be at least 0640 when owned by root or 0600 otherwise.

Property	Default	Unit	Required	Description
tls_ca_file		String	No	Certificate Authority (CA) file for TLS. This file must be owned by either the user running pgmoneta or root.
metrics_cert_file		String	No	Certificate file for TLS for Prometheus metrics. This file must be owned by either the user running pgmoneta or root.
metrics_key_file		String	No	Private key file for TLS for Prometheus metrics. This file must be owned by either the user running pgmoneta or root. Additionally permissions must be at least 0640 when owned by root or 0600 otherwise.
metrics_ca_file		String	No	Certificate Authority (CA) file for TLS for Prometheus metrics. This file must be owned by either the user running pgmoneta or root.

Property	Default	Unit	Required	Description
libev	auto	String	No	Select the libev backend to use. Valid options: <a href="#">auto</a> , <a href="#">select</a> , <a href="#">poll</a> , <a href="#">epoll</a> , <a href="#">iouring</a> , <a href="#">devpoll</a> and <a href="#">port</a>
backup_max_rate	0	Int	No	The number of bytes of tokens added every one second to limit the backup rate
network_max_rate	0	Int	No	The number of bytes of tokens added every one second to limit the network backup rate
verification	0	Int	No	The time between verification of a backup. If this value is specified without units, it is taken as seconds. Setting this parameter to 0 disables verification. It supports the following units as suffixes: 'S' for seconds (default), 'M' for minutes, 'H' for hours, 'D' for days, and 'W' for weeks.
keep_alive	on	Bool	No	Have <a href="#">SO_KEEPALIVE</a> on sockets

Property	Default	Unit	Required	Description
nodelay	on	Bool	No	Have <code>TCP_NODELAY</code> on sockets
non_blocking	on	Bool	No	Have <code>O_NONBLOCK</code> on sockets
backlog	16	Int	No	The backlog for <code>listen()</code> . Minimum 16
hugepage	<b>try</b>	String	No	Huge page support ( <code>off</code> , <b>try</b> , <code>on</code> )
pidfile		String	No	Path to the PID file. If not specified, it will be automatically set to <code>unix_socket_dir/pgmoneta.&lt;host&gt;.pid</code> where <code>&lt;host&gt;</code> is the value of the <code>host</code> parameter or <code>all</code> if <code>host = *</code> .

Property	Default	Unit	Required	Description
update_process_title	<code>verbose</code>	String	No	<p>The behavior for updating the operating system process title. Allowed settings are: <code>never</code> (or <code>off</code>), does not update the process title; <code>strict</code> to set the process title without overriding the existing initial process title length; <code>minimal</code> to set the process title to the base description; <code>verbose</code> (or <code>full</code>) to set the process title to the full description. Please note that <code>strict</code> and <code>minimal</code> are honored only on those systems that do not provide a native way to set the process title (e.g., Linux). On other systems, there is no difference between <code>strict</code> and <code>minimal</code> and the assumed behaviour is <code>minimal</code> even if <code>strict</code> is used. <code>never</code> and <code>verbose</code> are always honored, on every</p> <hr/> <p>system. On Linux 37 systems the process title is always trimmed to 255 characters, while on</p>

## 4.2 Server section

Property	Default	Unit	Required	Description
host		String	Yes	The address of the PostgreSQL instance
port		Int	Yes	The port of the PostgreSQL instance
user		String	Yes	The replication user name
wal_slot		String	Yes	The replication slot for WAL
create_slot	no	Bool	No	Create a replication slot for this server. Valid values are: yes, no
follow		String	No	Failover to this server if follow server fails
retention		Array	No	The retention for the server in days, weeks, months, years
wal_shipping		String	No	The WAL shipping directory
workspace	/tmp/pgmoneta- workspace/	String	No	The directory for the workspace that incremental backup can use for its work
hot_standby		String	No	Hot standby directory. Single directory or comma separated directories up to 8 (e.g., /path/to/hot/s-standby1,/path/to/hot/standby2)

Property	Default	Unit	Required	Description
hot_standby_overrides		String	No	Files to override in the hot standby directory. If multiple hot standbys are specified then this setting is separated by a
hot_standby_tablespaces		String	No	Tablespace mappings for the hot standby. Syntax is [from -> to,?]+. If multiple hot standbys are specified then this setting is separated by a
workers	-1	Int	No	The number of workers that each process can use for its work. Use 0 to disable, -1 means use the global setting. Maximum is CPU count
backup_max_rate	-1	Int	No	The number of bytes of tokens added every one second to limit the backup rate. Use 0 to disable, -1 means use the global setting
network_max_rate	-1	Int	No	The number of bytes of tokens added every one second to limit the network backup rate. Use 0 to disable, -1 means use the global setting

Property	Default	Unit	Required	Description
tls_cert_file		String	No	Certificate file for TLS. This file must be owned by either the user running pgmoneta or root.
tls_key_file		String	No	Private key file for TLS. This file must be owned by either the user running pgmoneta or root. Additionally permissions must be at least 0640 when owned by root or 0600 otherwise.
tls_ca_file		String	No	Certificate Authority (CA) file for TLS. This file must be owned by either the user running pgmoneta or root.
extra		String	No	The source directory for retrieval on the server side (details are in the extra section)

The [user](#) specified must have the [REPLICATION](#) option in order to stream the Write-Ahead Log (WAL), and must have access to the [postgres](#) database in order to get the necessary configuration parameters.

Note, that PostgreSQL 13+ is required, as well as having [wal\\_level](#) at [replica](#) or [logical](#) level.

Note, that if [host](#) starts with a / it represents a path and **pgmoneta** will connect using a Unix Domain Socket.

### 4.2.1 extra parameter

The `extra` configuration is set in the server section. It is not required, but if you configure this parameter, when you perform a backup using the CLI `pgmoneta-cli -c pgmoneta.conf backup primary`, it will also copy all specified files on the server side and send them back to the client side.

This `extra` feature requires the server side to install the `pgmoneta_ext` extension and also make the role `repl` a `SUPERUSER` (this will be improved in the future). Currently, this feature is only available to the `SUPERUSER` role.

You can set up `pgmoneta_ext` by following the README to easily install the extension. There are also more detailed instructions available in the DEVELOPERS documentation.

The format for the `extra` parameter is a path to a file or directory. You can list more than one file or directory separated by commas. The format is as follows:

```
extra = /tmp/myfile1, /tmp/myfile2, /tmp/mydir1, /tmp/mydir2
```

## 4.3 pgmoneta\_users configuration

The `pgmoneta_users` configuration defines the users known to the system. This file is created and managed through the `pgmoneta-admin` tool.

The configuration is loaded from either the path specified by the `-u` flag or `/etc/pgmoneta/pgmoneta_users.conf`.

## 4.4 pgmoneta\_admins configuration

The `pgmoneta_admins` configuration defines the administrators known to the system. This file is created and managed through the `pgmoneta-admin` tool.

The configuration is loaded from either the path specified by the `-A` flag or `/etc/pgmoneta/pgmoneta_admins.conf`.

If `pgmoneta` has both Transport Layer Security (TLS) and `management` enabled then `pgmoneta-cli` can connect with TLS using the files `~/.pgmoneta/pgmoneta.key` (must be 0600 permission), `~/.pgmoneta/pgmoneta.crt` and `~/.pgmoneta/root.crt`.

## 5 pgmoneta\_walinfo configuration

The `pgmoneta_walinfo` configuration defines the info needed for `walinfo` to work.

The configuration is loaded from either the path specified by the `-c` flag or `/etc/pgmoneta/pgmoneta_walinfo.conf` if `-c` wasn't provided.

### 5.1 [pgmoneta\_walinfo]

Property	Default	Unit	Required	Description
log_type	console	String	No	The logging type (console, file, syslog)
log_level	info	String	No	The logging level, any of the (case insensitive) strings <code>FATAL</code> , <code>ERROR</code> , <code>WARN</code> , <code>INFO</code> and <code>DEBUG</code> (that can be more specific as <code>DEBUG1</code> thru <code>DEBUG5</code> ). Debug level greater than 5 will be set to <code>DEBUG5</code> . Not recognized values will make the log_level be <code>INFO</code>
log_path	pgmoneta.log	String	No	The log file location. Can be a strftime(3) compatible string.

### 5.2 Server section

Property	Default	Unit	Required	Description
host		String	Yes	The address of the PostgreSQL instance
port		Int	Yes	The port of the PostgreSQL instance
user		String	Yes	The replication user name

## 6 Tutorials

### 6.1 Install pgmoneta

This tutorial will show you how to do a simple installation of **pgmoneta**.

At the end of this tutorial you will have a backup of a PostgreSQL cluster, and will be streaming Write-Ahead Log (WAL) to **pgmoneta**.

Please note that inside the brackets at the end of each step it's the user account you should be using, switch the account when needed.

#### 6.1.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and **pgmoneta**.

For RPM based distributions such as Fedora and RHEL you can add the PostgreSQL YUM repository and do the install via

```
dnf -qy module disable postgresql
dnf install -y postgresql13 postgresql13-server pgmoneta
```

#### 6.1.2 Initialize cluster

```
export PATH=/usr/pgsql-13/bin:$PATH
initdb -k /tmp/pgsql
```

(postgres user)

#### 6.1.3 Remove default access

Remove

host	all	all	127.0.0.1/32	trust
host	all	all	:::1/128	trust
host	replication	all	127.0.0.1/32	trust
host	replication	all	:::1/128	trust

from /tmp/pgsql/pg\_hba.conf

(postgres user)

#### 6.1.4 Add access for users and a database

Add

host	mydb	myuser	127.0.0.1/32	md5
host	mydb	myuser	:::1/128	md5
host	postgres	repl	127.0.0.1/32	md5
host	postgres	repl	:::1/128	md5
host	replication	repl	127.0.0.1/32	md5
host	replication	repl	:::1/128	md5

to `/tmp/pgsql/pg_hba.conf`

Remember to check the value of `password_encryption` in `/tmp/pgsql/postgresql.conf` to setup the correct authentication type.

(postgres user)

#### 6.1.5 Make sure that replication level is set

Check that

```
wal_level = replica
```

is set in `/tmp/pgsql/postgresql.conf` - or `logical`

(postgres user)

#### 6.1.6 Start PostgreSQL

```
pg_ctl -D /tmp/pgsql/ start
```

(postgres user)

#### 6.1.7 Add users and a database

```
createuser -P myuser  
createdb -E UTF8 -O myuser mydb
```

with `mypass` as the password.

Then

```
psql postgres
CREATE ROLE repl WITH LOGIN REPLICATION PASSWORD 'secretpassword';
\q
```

(postgres user)

#### 6.1.8 Add Write-Ahead Log (WAL) replication slot

```
psql postgres
SELECT pg_create_physical_replication_slot('repl', true, false);
\q
```

(postgres user)

#### 6.1.9 Verify access

For the user `myuser` using `mypass` as the password

```
psql -h localhost -p 5432 -U myuser mydb
\q
```

For the user `repl` using `secretpassword` as the password

```
psql -h localhost -p 5432 -U repl postgres
\q
```

(postgres user)

#### 6.1.10 Add pgmoneta user

```
sudo su -
useradd -ms /bin/bash pgmoneta
passwd pgmoneta
exit
```

(postgres user)

#### 6.1.11 Create pgmoneta configuration

Switch to the pgmoneta user

```
sudo su -
su - pgmoneta
```

Add the master key and create vault

```
pgmoneta-admin master-key  
pgmoneta-admin -f pgmoneta_users.conf -U repl user add
```

You have to choose a password for the master key - remember it !

For scripted use, the master key and user password can be provided using the `PGMONETA_PASSWORD` environment variable.

If you see an error saying `error while loading shared libraries: libpgmoneta.so.0: cannot open shared object` running the above command, you may need to locate where your `libpgmoneta.so.0` is. It could be in `/usr/local/lib` or `/usr/local/lib64` depending on your environment. Add the corresponding directory into `/etc/ld.so.conf`, or alternatively, create a file called `pgmoneta_shared_library.conf` under `/etc/ld.so.conf.d/`, and add your directory into it. Remember to run `ldconfig` to make the change effective

Create the `pgmoneta.conf` configuration

```
cat > pgmoneta.conf  
[pgmoneta]  
host = *  
metrics = 5001  
create_slot = yes  
  
base_dir = /home/pgmoneta/backup  
  
compression = zstd  
  
storage_engine = local  
  
retention = 7  
  
log_type = file  
log_level = info  
log_path = /tmp/pgmoneta.log  
  
unix_socket_dir = /tmp/  
  
[primary]  
host = localhost  
port = 5432  
user = repl  
wal_slot = repl
```

and press `Ctrl-d`

(pgmoneta user)

### 6.1.12 Create base directory

```
mkdir backup
```

(pgmoneta user)

### 6.1.13 Start pgmoneta

```
pgmoneta -c pgmoneta.conf -u pgmoneta_users.conf
```

(pgmoneta user)

### 6.1.14 Create a backup

In another terminal

```
pgmoneta-cli -c pgmoneta.conf backup primary
```

(pgmoneta user)

### 6.1.15 View backup

In another terminal

```
pgmoneta-cli -c pgmoneta.conf status details
```

(pgmoneta user)

### 6.1.16 Shell completion

There is a minimal shell completion support for `pgmoneta-cli` and `pgmoneta-admin`. If you are running such commands from a Bash or Zsh, you can take some advantage of command completion.

**6.1.16.1 Installing command completions in Bash** There is a completion script into `contrib/shell_comp/pgmoneta_comp.bash` that can be used to help you complete the command line while you are typing.

It is required to source the script into your current shell, for instance by doing:

```
source contrib/shell_comp/pgmoneta_comp.bash
```

At this point, the completions should be active, so you can type the name of one the commands between `pgmoneta-cli` and `pgmoneta-admin` and hit `<TAB>` to help the command line completion.

**6.1.16.2 Installing the command completions on Zsh** In order to enable completion into `zsh` you first need to have `compinit` loaded; ensure your `.zshrc` file contains the following lines:

```
autoload -U compinit
compinit
```

and add the sourcing of the `contrib/shell_comp/pgmoneta_comp.zsh` file into your `~/.zshrc` also associating the `_pgmoneta_cli` and `_pgmoneta_admin` functions to completion by means of `compdef`:

```
source contrib/shell_comp/pgmoneta_comp.zsh
compdef _pgmoneta_cli    pgmoneta-cli
compdef _pgmoneta_admin pgmoneta-admin
```

If you want completions only for one command, e.g., `pgmoneta-admin`, remove the `compdef` line that references the command you don't want to have automatic completion. At this point, digit the name of a `pgmoneta-cli` or `pgmoneta-admin` command and hit `<TAB>` to trigger the completion system.

## 6.2 Remote administration for pgmoneta

This tutorial will show you how to do setup remote management for **pgmoneta**.

### 6.2.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and **pgmoneta**.

See Install pgmoneta for more detail.

### 6.2.2 Change the pgmoneta configuration

Change `pgmoneta.conf` to add

```
management = 5002
```

under the `[pgmoneta]` setting, like

pgmoneta

---

```
[pgmoneta]
...
management = 5002
```

(pgmoneta user)

### 6.2.3 Add pgmoneta admin

```
pgmoneta-admin -f pgmoneta_admins.conf -U admin -P admin1234 user add
```

(pgmoneta user)

### 6.2.4 Restart pgmoneta

Shutdown pgmoneta and start it again with

```
pgmoneta-cli -c pgmoneta.conf shutdown
pgmoneta -c pgmoneta.conf -u pgmoneta_users.conf -A pgmoneta_admins.conf
```

(pgmoneta user)

### 6.2.5 Connect via remote administration interface

```
pgmoneta-cli -h localhost -p 5002 -U admin status details
```

and use `admin1234` as the password

(pgmoneta user)

### 6.2.6 Using Transport Level Security for access

You can security the administration level interface by using Transport Level Security (TLS).

It is done by setting the following options,

```
[pgmoneta]
tls_cert_file=/path/to/server.crt
tls_key_file=/path/to/server.key
tls_ca_file=/path/to/root.crt

...
```

in `pgmoneta.conf`.

The client side setup must go into `~/.pgmoneta/` with the following files

```
~/.pgmoneta/pgmoneta.key  
~/.pgmoneta/pgmoneta.crt  
~/.pgmoneta/root.crt
```

They must have 0600 permission.

## 6.3 Prometheus metrics for pgmoneta

This tutorial will show you how to do setup Prometheus metrics for **pgmoneta**.

### 6.3.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and **pgmoneta**.

See Install pgmoneta for more detail.

### 6.3.2 Change the pgmoneta configuration

Change `pgmoneta.conf` to add

```
metrics = 5001
```

under the `[pgmoneta]` setting, like

```
[pgmoneta]  
...  
metrics = 5001
```

(`pgmoneta` user)

### 6.3.3 Restart pgmoneta

Shutdown pgmoneta and start it again with

```
pgmoneta-cli -c pgmoneta.conf shutdown  
pgmoneta -c pgmoneta.conf -u pgmoneta_users.conf
```

(`pgmoneta` user)

### 6.3.4 Get Prometheus metrics

You can now access the metrics via

```
http://localhost:5001/metrics
```

(pgmoneta user)

### 6.3.5 TLS support

To add TLS support for Prometheus metrics, first we need a self-signed certificate. 1. Generate CA key and certificate

```
openssl genrsa -out ca.key 2048
openssl req -x509 -new -nodes -key ca.key -sha256 -days 3650 -out ca.crt -
    subj "/CN=My Local CA"
```

2. Generate server key and CSR

```
openssl genrsa -out server.key 2048
openssl req -new -key server.key -out server.csr -subj "/CN=localhost"
```

3. Create a config file for Subject Alternative Name

```
cat > server.ext << EOF
authorityKeyIdentifier=keyid,issuer
basicConstraints=CA:FALSE
keyUsage = digitalSignature, nonRepudiation, keyEncipherment,
    dataEncipherment
subjectAltName = @alt_names

[alt_names]
DNS.1 = localhost
IP.1 = 127.0.0.1
EOF
```

4. Sign the server certificate with our CA

```
openssl x509 -req -in server.csr -CA ca.crt -CAkey ca.key -CAcreateserial
    -out server.crt -days 3650 -sha256 -extfile server.ext
```

5. Generate client key and certificate

```
openssl genrsa -out client.key 2048
openssl req -new -key client.key -out client.csr -subj "/CN=Client
    Certificate"
```

```
openssl x509 -req -in client.csr -CA ca.crt -CAkey ca.key -CAcreateserial  
-out client.crt -days 3650 -sha256
```

6. Create PKCS#12 file (Optional, needed for browser import)

```
openssl pkcs12 -export -out client.p12 -inkey client.key -in client.crt -  
certfile ca.crt -passout pass:<your_password>
```

Edit `pgmoneta.conf` to add the following keys under `pgmoneta` section:

```
[pgmoneta]  
.  
.  
.  
metrics_cert_file=<path_to_server_cert_file>  
metrics_key_file=<path_to_server_key_file>  
metrics_ca_file=<path_to_ca_file>
```

You can now access the metrics at `https://localhost:5001` using curl as follows:

```
curl -v -L "https://localhost:5001" --cacert <path_to_ca_file> --cert <  
path_to_client_cert_file> --key <path_to_client_key_file>
```

(Optional) If you want to access the page through the browser: - First install the certificates on your system - For Fedora: “ # Create directory if it doesn’t exist `sudo mkdir -p /etc/pki/ca-trust/source/anchors/`

```
# Copy CA cert to the trust store  
sudo cp ca.crt /etc/pki/ca-trust/source/anchors/  
  
# Update the CA trust store  
sudo update-ca-trust extract  
“ “ “  
  
- For Ubuntu:  
“ “ “  
# Copy the CA certificate to the system certificate store  
sudo cp ca.crt /usr/local/share/ca-certificates/  
  
# Update the CA certificate store  
sudo update-ca-certificates  
“ “ “  
  
- For MacOS:  
- Open Keychain Access and import the certificate file  
- Set the certificate to "Always Trust"
```

- For browsers like Firefox
  - Go to Menu → Preferences → Privacy & Security

- Scroll down to “Certificates” section and click “View Certificates”
  - Go to “Authorities” tab and click “Import”
  - Select your `ca.crt` file
  - Check “Trust this CA to identify websites” and click OK
  - Go to “Your Certificates” tab
  - Click “Import” and select the `client.p12` file
  - Enter the password you set when creating the PKCS#12 file
- For browsers like Chrome/Chromium
    - For client certificates, go to Settings → Privacy and security → Security → Manage certificates
    - Click on “Import” and select your `client.p12` file
    - Enter the password you set when creating it

You can now access metrics at <https://localhost:5001>

## 6.4 Backup and restore

This tutorial will show you how to do a backup and a restore using **pgmoneta**.

### 6.4.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and **pgmoneta**.

See Install pgmoneta for more detail.

### 6.4.2 Backup

```
pgmoneta-cli -c pgmoneta.conf backup primary
```

will take a backup of the `[primary]` host.

(pgmoneta user)

### 6.4.3 List backups

```
pgmoneta-cli -c pgmoneta.conf list-backup primary
```

(pgmoneta user)

#### 6.4.4 Restore

```
pgmoneta-cli -c pgmoneta.conf restore primary newest current /tmp/
```

will take the latest backup and all Write-Ahead Log (WAL) segments and restore it into the `/tmp/primary-<timestamp>` directory for an up-to-date copy.

The 2nd to last parameter allows

- `current` means copy the Write-Ahead Log (WAL ), and restore to first stable checkpoint
- `name=X` means copy the Write-Ahead Log (WAL ), and restore to the label specified
- `xid=X` means copy the Write-Ahead Log (WAL ), and restore to the XID specified
- `time=X` means copy the Write-Ahead Log (WAL ), and restore to the timestamp specified
- `lsn=X` means copy the Write-Ahead Log (WAL ), and restore to the Log Sequence Number (LSN) specified
- `inclusive=X` means that the restore is inclusive of the specified information
- `timeline=X` means that the restore is done to the specified information timeline
- `action=X` means which action should be executed after the restore (pause, shutdown)
- `primary` means that the cluster is setup as a primary
- `replica` means that the cluster is setup as a replica

More information

(`pgmoneta` user)

### 6.5 Verify

This tutorial will show you how to verify a backup using **pgmoneta**.

#### 6.5.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and **pgmoneta**.

See Install pgmoneta for more detail.

#### 6.5.2 Verify

```
pgmoneta-cli -c pgmoneta.conf verify primary oldest /tmp
```

will verify the oldest backup of the `[primary]` host.

(`pgmoneta` user)

## 6.6 Archive

This tutorial will show you how to do an archive using **pgmoneta**.

### 6.6.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and **pgmoneta**.

See Install pgmoneta for more detail.

### 6.6.2 Creating an archive

```
pgmoneta-cli -c pgmoneta.conf archive primary newest current /tmp/
```

will take the latest backup and all Write-Ahead Log (WAL) segments and create an archive named `/tmp/primary-<timestamp>.tar.zstd`. This archive will contain an up-to-date copy.

(pgmoneta user)

## 6.7 Delete a backup

This tutorial will show you how to delete a backup from **pgmoneta**.

### 6.7.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and **pgmoneta**.

See Install pgmoneta for more detail.

### 6.7.2 Delete the oldest backup

```
pgmoneta-cli -c pgmoneta.conf delete primary oldest
```

will delete the oldest backup on `[primary]`.

Note that if the backup has an incremental backup child that depends on it, its data will be rolled up to its child before getting deleted.

(pgmoneta user)

## 6.8 Encryption and Decryption

This tutorial will show you how to use encryption and decryption features in **pgmoneta**.

### 6.8.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and **pgmoneta**.

See Install pgmoneta for more detail.

### 6.8.2 Enable Encryption and Decryption in pgmoneta workflow

By default, the encryption is disabled. To enable this feature, modify `pgmoneta.conf`:

```
encryption = aes-256-cbc
```

(pgmoneta user)

Many encryption modes are supported, see Configuration for details.

### 6.8.3 Encryption and Decryption Commands

**pgmoneta** use the same key created by `pgmoneta-admin master-key` to encrypt and decrypt files.

Encrypt a file with `pgmoneta-cli encrypt`, the file will be encrypted in place and remove unencrypted file on success.

```
pgmoneta-cli -c pgmoneta.conf encrypt '<path-to-your-file>/file.tar.zstd'
```

Decrypt a file with `pgmoneta-cli decrypt`, the file will be decrypted in place and remove encrypted file on success.

```
pgmoneta-cli -c pgmoneta.conf decrypt '<path-to-your-file>/file.tar.zstd.  
aes'
```

`pgmoneta-cli encrypt` and `pgmoneta-cli decrypt` are built to deal with files created by `pgmoneta-cli archive`. It can be used on other files though.

## 6.9 Retention Policy

This tutorial will show you how to configure retention to retain backups.

### 6.9.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and **pgmoneta**.

See Install pgmoneta for more detail.

### 6.9.2 Retention Setup

In `pgmoneta.conf`, you can use `retention = 7, 4, 12, 5` to configure **pgmoneta** to retain backups within the nearest 7 days, 4 weeks, 12 months and 5 years. Specifically, **pgmoneta** will retain all the backups within the nearest 7 days, the latest backup on each Monday within the nearest 4 weeks, the latest backup on the first day of each month in the last 12 months and the latest backup on the first day of each year in the last 5 years. If you input more than 4 values, **pgmoneta** will only read the first 4.

Note that if a backup has an incremental backup child that depends on it, its data will be rolled up to its child before getting deleted.

There are a lot of ways to leave a parameter unspecified. For trailing parameters, you can simply omit them. And for parameters in between, you can use placeholders. Currently, placeholders we allow are: `-`, `X`, `x`, `0` or whitespaces (spaces or tabs).

Please note that you should always configure `days` to retain the nearest backups. If you don't configure retention, by default **pgmoneta** keeps backups within the nearest 7 days and other parameters (weeks, months, years) are unspecified. Additionally, if you are using prometheus, unspecified values will be shown as `0`.

### 6.9.3 Retention Validation Rule

Current validation rule is:

1. Retention days  $\geq 1$
2. If retention months is specified, then  $1 \leq \text{weeks} \leq 4$ , otherwise weeks  $\geq 1$
3. If retention years is specified, then  $1 \leq \text{months} \leq 12$ , otherwise months  $\geq 1$
4. Retention years  $\geq 1$  Please note that the rule above only checks specified parameters, except for days, which should always be specified

### 6.10 Retention check

The retention check runs every 5 minutes, and will delete one backup per run.

You can change this to every 30 minutes by

```
retention_interval = 1800
```

under the [pgmoneta] configuration.

## 6.11 Grafana Dashboard

This tutorial will show you how to encapsulate Prometheus standard API and use them to monitor state of **pgmoneta** with the help of Grafana dashboard.

### 6.11.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and **pgmoneta**.

See Install pgmoneta for more detail.

### 6.11.2 Prometheus Configuration

First of all, you should install Prometheus in your **pgmoneta** server.

After you successfully installed Prometheus, you should replace `prometheus.yml` with the content below to configure how to query your **pgmoneta** metrics.

```
scrape_configs:
  - job_name: 'pgmoneta'
    metrics_path: '/metrics'
    static_configs:
      - targets: ['localhost:5001']
```

Then the Prometheus service will query your **pgmoneta** metrics every 15 seconds and package them as time-series data. You can query your **pgmoneta** metrics and watch their changes as time passed in Prometheus web page (default port is 9090).

### 6.11.3 Grafana Dashboard Import

Although Prometheus provides capacity of querying and monitoring metrics, we can not customize graphs for each metric and provide a unified view.

As a result, we use Grafana to help us manage all graphs together. First of all, we should install Grafana in the computer you need to monitor **pgmoneta** metrics. You can browse Grafana web page with default port 3000, default user `admin` and default password `admin`. Then you can create Prometheus data source of **pgmoneta**.

Finally you can create dashboard by importing `contrib/grafana/dashboard.json` and monitor metrics about **pgmoneta**.

## 6.12 WAL shipping

This tutorial will show you how to configure WAL shipping, so that if the backup server crashes, you will be able to use an older archive to do Point-in-Time recovery with WAL segments shipped to another server/local directory.

Note that this feature is still at its early stages, that it currently only ships WAL segments to another LOCAL directory. You do not need to make sure the directory is unique for each server, the WAL copy will be saved under the subdirectory `server_name/wal/`

### 6.12.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and **pgmoneta**.

See Install pgmoneta for more detail.

### 6.12.2 Configuration

In order to use WAL shipping, simply add

```
wal_shipping = your/local/wal/shipping/directory
```

to the corresponding server section of `pgmoneta.conf`, **pgmoneta** will create the directory if it doesn't exist, and ship a copy of WAL segments under the subdirectory `your/local/wal/shipping/directory/server_name/wal`.

### 6.12.3 Prometheus

You can monitor the disk usage regarding WAL shipping using prometheus. Here are some metrics.

```
pgmoneta_wal_shipping(name) -- size of the WAL shipping for the server (
    wal/shipping/directory/server_name/wal)
pgmoneta_wal_shipping_used_space -- size of everything under the WAL
    shipping directory; this could include archives (wal/shipping/directory
    /server_name/)
pgmoneta_wal_shipping_free_space -- free size of the WAL shipping
    directory for the server (wal/shipping/directory/server_name/)
pgmoneta_wal_shipping_total_space -- total size of the WAL shipping
    directory for the server (wal/shipping/directory/server_name/)
```

## 6.13 Use of Transport Level Security (TLS)

This tutorial is about using Transport Level Security (TLS) in PostgreSQL, and how it affects **pgmoneta**.

**Note, that this tutorial is an example on how to setup a PostgreSQL TLS environment for development use only !**

### 6.13.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+, OpenSSL and **pgmoneta**.

See Install pgmoneta for more detail.

### 6.13.2 PostgreSQL

Generate the server key

```
openssl genrsa -aes256 8192 > server.key
```

Remove the passphrase

```
openssl rsa -in server.key -out server.key
```

Set the server key permission

```
chmod 400 server.key
```

Generate the server certificate

```
openssl req -new -key server.key -days 3650 -out server.crt -x509
```

Use the server certificate as the root certificate (self-signed)

```
cp server.crt root.crt
```

In `postgresql.conf` change the following settings

```
listen_addresses = '*'
ssl = on
ssl_ca_file = '/path/to/root.crt'
ssl_cert_file = '/path/to/server.crt'
ssl_key_file = '/path/to/server.key'
ssl_prefer_server_ciphers = on
```

In `pg_hba.conf` change

pgmoneta

---

host	all	all	0.0.0.0/0	scram-sha-256
------	-----	-----	-----------	---------------

to

hostssl	all	all	0.0.0.0/0	scram-sha-256
---------	-----	-----	-----------	---------------

In this scenario there are no changes to the `pgmoneta.conf` configuration file.

### 6.13.3 Using client certificate

Create the client key

```
openssl ecparam -name prime256v1 -genkey -noout -out client.key
```

Create the client request - remember that the CN has to have the name of the replication user

```
openssl req -new -sha256 -key client.key -out client.csr -subj "/CN=repl"
```

Generate the client certificate

```
openssl x509 -req -in client.csr -CA root.crt -CAkey server.key -  
CAcreateserial -out client.crt -days 3650 -sha256
```

You can test your setup by copying the files into the default PostgreSQL client directory, like

```
mkdir ~/.postgresql  
cp client.crt ~/.postgresql/postgresql.crt  
cp client.key ~/.postgresql/postgresql.key  
cp root.crt ~/.postgresql/ca.crt  
chmod 0600 ~/.postgresql/postgresql.crt ~/.postgresql/postgresql.key ~/.  
postgresql/ca.crt
```

and then test with the `psql` command.

In `pg_hba.conf` change

hostssl	all	all	0.0.0.0/0	scram-sha-256
---------	-----	-----	-----------	---------------

to

hostssl	all	all	0.0.0.0/0	scram-sha-256
clientcert=verify-ca				

In `pgmoneta.conf` add the paths to the server in question, like

```
[pgmoneta]  
...
```

```
[primary]
host=...
port=...
user=repl
tls_cert_file=/path/to/home/.postgresql/postgresql.crt
tls_key_file=/path/to/home/.postgresql/postgresql.key
tls_ca_file=/path/to/home/.postgresql/ca.crt
```

#### 6.13.4 More information

- Secure TCP/IP Connections with SSL
- The pg\_hba.conf File

### 6.14 Hot standby

This tutorial will show you how to configure hot standby instances.

#### 6.14.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and **pgmoneta**.

See Install pgmoneta for more detail.

#### 6.14.2 Configuration

In order to use hot standby, simply add

```
hot_standby = /your/local/hot/standby/directory
```

to the corresponding server section of `pgmoneta.conf`. **pgmoneta** will create the directory if it doesn't exist, and keep the latest backup in the defined directory.

You can also configure multiple hot standby directories (up to 8) by providing comma-separated paths:

```
/path/to/hot/standby1,/path/to/hot/standby2,/path/to/hot/standby3
```

**pgmoneta** will maintain identical copies of the hot standby in all specified directories.

You can use

```
hot_standby_overrides = /your/local/hot/standby/overrides/
```

to override files in the `hot_standby` directories. The overrides will be applied to all `hot_standby` directories.

### 6.14.3 Tablespaces

By default tablespaces will be mapped to a similar path than the original one, for example `/tmp/mytblspc` becomes `/tmp/mytblspchs`.

However, you can use the directory name to map it to another directory, like

```
hot_standby_tablespaces = /tmp/mytblspc->/tmp/mybcktblspc
```

You can also use the `OID` for the key part, like

```
hot_standby_tablespaces = 16392->/tmp/mybcktblspc
```

Multiple tablespaces can be specified using a `,` between them.

## 6.15 Annotate a backup with comments

This tutorial is about adding comments to a backup.

### 6.15.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+, OpenSSL and **pgmoneta**.

See Install `pgmoneta` for more detail.

### 6.15.2 Add a comment

You can add a comment by

```
pgmoneta-cli -c pgmoneta.conf annotate primary newest add mykey mycomment
```

### 6.15.3 Update a comment

You can update a comment by

```
pgmoneta-cli -c pgmoneta.conf annotate primary newest update mykey  
mynewcomment
```

#### 6.15.4 Remove a comment

You can remove a comment by

```
pgmoneta-cli -c pgmoneta.conf annotate primary newest remove mykey
```

#### 6.15.5 View comments

You can view the comments by

```
pgmoneta-cli -c pgmoneta.conf info primary newest
```

### 6.16 Feature extra

This tutorial will show you how to configure the [extra](#) feature to retrieve extra files and directories (recursively) from the PostgreSQL server instance.

#### 6.16.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+, **pgmoneta\_ext**, and **pgmoneta**.

See [Install pgmoneta\\_ext](#) and [Install pgmoneta](#) for more detail.

#### 6.16.2 Configuration

In order to use [extra](#), simply add

```
extra = /tmp/myfile, /tmp/mydir, /tmp/mydirs
```

to the corresponding server section of [pgmoneta.conf](#). **pgmoneta** will retrieve [extra](#) files and directories (recursively) from the PostgreSQL server instance when performing a backup.

You can use

```
pgmoneta-cli -c pgmoneta.conf backup primary
```

to trigger the client to get [extra](#) files from the server side.

All the files will be stored in the [/extra](#) directory under the backup directory. For our configuration, they will be stored in the [/tmp/primary/<timestamp>/extra](#) directory.

### 6.16.3 Info

You can use

```
pgmoneta-cli -c pgmoneta.conf info primary newest
```

to show all copied `extra` files, something like this (only showing successfully copied files):

```
Extra          : myfile, ...
```

## 6.17 Incremental backup and restore

This tutorial will show you how to do an incremental backup and a restore using **pgmoneta**.

### 6.17.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 17+ and **pgmoneta**.

See Install pgmoneta for more detail.

### 6.17.2 Full backup

```
pgmoneta-cli -c pgmoneta.conf backup primary
```

will take a full backup of the `[primary]` host.

(`pgmoneta` user)

### 6.17.3 List backups

```
pgmoneta-cli -c pgmoneta.conf list-backup primary
```

(`pgmoneta` user)

### 6.17.4 Incremental backup

```
pgmoneta-cli -c pgmoneta.conf backup primary newest
```

will take an incremental backup of the `[primary]` host.

Note that currently branching is not allowed for incremental backup – a backup can have at most 1 incremental backup child.

(pgmoneta user)

### 6.17.5 List backups

```
pgmoneta-cli -c pgmoneta.conf list-backup primary
```

(pgmoneta user)

### 6.17.6 Restore

```
pgmoneta-cli -c pgmoneta.conf restore primary newest current /tmp/
```

will take the latest backup and all Write-Ahead Log (WAL) segments and restore it into the `/tmp/primary-<timestamp>` directory for an up-to-date copy.

The 2nd to last parameter allows

- `current` means copy the Write-Ahead Log (WAL ), and restore to first stable checkpoint
- `name=X` means copy the Write-Ahead Log (WAL ), and restore to the label specified
- `xid=X` means copy the Write-Ahead Log (WAL ), and restore to the XID specified
- `time=X` means copy the Write-Ahead Log (WAL ), and restore to the timestamp specified
- `lsn=X` means copy the Write-Ahead Log (WAL ), and restore to the Log Sequence Number (LSN) specified
- `inclusive=X` means that the restore is inclusive of the specified information
- `timeline=X` means that the restore is done to the specified information timeline
- `action=X` means which action should be executed after the restore (pause, shutdown)
- `primary` means that the cluster is setup as a primary
- `replica` means that the cluster is setup as a replica

More information

(pgmoneta user)

## 7 Running pgmoneta with Docker

You can run `pgmoneta` using Docker instead of compiling it manually.

## 7.1 Prerequisites

- **Docker** or **Podman** must be installed on the server where PostgreSQL is running.
  - Ensure PostgreSQL is configured to allow external connections.
- 

## 7.2 Step 1: Enable External PostgreSQL Access

Modify the local PostgreSQL server's `postgresql.conf` file to allow connections from outside:

```
listen_addresses = '*'
```

Update `pg_hba.conf` to allow remote connections:

```
host    all    all    0.0.0.0/0    scram-sha-256
```

Then, restart PostgreSQL for the changes to take effect:

```
sudo systemctl restart postgresql
```

---

## 7.3 Step 2: Clone the Repository

```
git clone https://github.com/pgmoneta/pgmoneta.git
cd pgmoneta
```

---

## 7.4 Step 3: Build the Docker Image

There are two Dockerfiles available: 1. **Alpine-based image**

**Using Docker** `sh docker build -t pgmoneta:latest -f ./contrib/docker/Dockerfile.alpine .` **Using Podman** `sh podman build -t pgmoneta:latest -f ./contrib/docker/Dockerfile.alpine .`

### 2. Rocky Linux 9-based image

**Using Docker**

---

```
docker build -t pgmoneta:latest -f ./contrib/docker/Dockerfile.rocky9 .
```

### Using Podman

```
podman build -t pgmoneta:latest -f ./contrib/docker/Dockerfile.rocky9 .
```

---

## 7.5 Step 4: Run pgmoneta as a Docker Container

Once the image is built, run the container using: - **Using Docker** `sh docker run -d --name pgmoneta --network host pgmoneta:latest` - **Using Podman** `sh podman run -d --name pgmoneta --network host pgmoneta:latest`

---

## 7.6 Step 5: Verify the Container

Check if the container is running:

- **Using Docker** `sh docker ps | grep pgmoneta`
- **Using Podman** `sh podman ps | grep pgmoneta`

Check logs for any errors: - **Using Docker** `sh docker logs pgmoneta` - **Using Podman** `sh podman logs pgmoneta`

You can also inspect the exposed server at:

```
http://localhost:5001/
```

# 8 Test

## 8.1 Local Environment

To ensure the test suite works well, please make sure you have installed PostgreSQL 17.x version installed

For RPM based distributions such as Fedora and RHEL you can add the PostgreSQL YUM repository and do the install via

```
dnf -qy module disable postgresql
dnf install -y postgresql17 postgresql17-server pgmoneta
```

also make sure that the `initdb`, `pg_ctl` and `psql` are in PATH variable.

### 8.1.1 Add Path variable

Add the `initdb`, `pg_ctl` and `psql` binaries into the environment path.

```
export PATH=$PATH:${dirname $(which initdb)}
export PATH=$PATH:${dirname $(which psql)}
```

**Note:** `initdb` and `pg_ctl` belongs to same binary directory

### 8.1.2 Install check library

Before you test, you need to install the `check` library. If there is no package for `check`, the `CMakeLists.txt` will not compile the test suite. Only after you have installed `check` will it compile the test suite.

```
dnf install -y check check-devel check-static
```

### 8.1.3 Build the project

Make sure to execute the test script inside the project build. Run the following commands if project is not already built.

```
git clone https://github.com/pgmoneta/pgmoneta.git
cd pgmoneta
mkdir build
cd build
cmake -DCMAKE_C_COMPILER=clang -DCMAKE_BUILD_TYPE=Debug ..
make
```

### 8.1.4 Run test suites

To run the testsuites get inside your build and just execute -

```
./testsuite.sh
```

The script creates the PostgreSQL and pgmoneta environment inside the build itself for example - - the PostgreSQL related files like the data directory and PostgreSQL configuration will be stored in `pgmoneta-postgres` - the pgmoneta related files like pgmoneta configuration and users file will be stored in `pgmoneta-testsiute`

It will be the responsibility of the script to clean up the setup environment.

**Note:** You can however view the PostgreSQL and pgmoneta server logs in a separate `log` directory inside build.

In case you see those setup directories like `pgmoneta-postgres` and `pgmoneta-testsiute` in build after successfully executing the script, you should probably run

```
./testsuite clean
```

before running the script again to avoid any inconsistency or errors. The clean subcommand will however clean the logs as well.

#### 8.1.5 Add testcases

To add an additional testcase go to testcases directory inside the `pgmoneta` project.

Create a `.c` file that contains the test suite and its corresponding `.h` file (see `pgmoneta_test_1.c` or `pgmoneta_test_2.c` for reference). Add the above created suite to the test runner in `runner.c`

Also remember to link the new test suite in `CMakeLists` file inside test directory

```
30: set(SOURCES
31:     testcases/common.c
32:     testcases/pgmoneta_test_1.c
33:     testcases/pgmoneta_test_2.c
34:     testcases/runner.c
35: )
```

## 9 Command line interface

The **pgmoneta-cli** command line interface controls your interaction with **pgmoneta**.

**It is important that you only use the pgmoneta-cli command line interface to operate on your backup directory**

Using other commands on the backup directory could cause problems.

```
pgmoneta-cli 0.18.0
  Command line utility for pgmoneta

Usage:
  pgmoneta-cli [ -c CONFIG_FILE ] [ COMMAND ]

Options:
  -c, --config CONFIG_FILE          Set the path to the
    pgmoneta.conf file
  -h, --host HOST                   Set the host name
  -p, --port PORT                   Set the port number
  -U, --user USERNAME               Set the user name
  -P, --password PASSWORD           Set the password
  -L, --logfile FILE                Set the log file
  -v, --verbose                     Output text string of
    result
  -V, --version                     Display version
    information
  -F, --format text|json|raw        Set the output format
  -C, --compress none|gz|zstd|lz4|bz2 Compress the wire
    protocol
  -E, --encrypt none|aes|aes256|aes192|aes128 Encrypt the wire
    protocol
  -s, --sort asc|desc               Sort result (for list-
    backup)
    --cascade                       Cascade a retain/expunge
    backup
  -?, --help                       Display help

Commands:
  annotate                         Annotate a backup with comments
  archive                         Archive a backup from a server
  backup                         Backup a server
  clear <what>                   Clear data, with:
    - 'prometheus' to reset the Prometheus
    statistics
  compress                       Compress a file using configured method
  conf <action>                 Manage the configuration, with one of
    subcommands:
    - 'get' to obtain information about a runtime
    configuration value
```

	<code>conf get &lt;parameter_name&gt;</code>
	- <code>'ls'</code> to print the configurations used
	- <code>'reload'</code> to reload the configuration
	- <code>'set'</code> to modify a configuration value;
	<code>conf set &lt;parameter_name&gt; &lt;parameter_value&gt;;</code>
<code>decompress</code>	Decompress a file using configured method
<code>decrypt</code>	Decrypt a file using master-key
<code>delete</code>	Delete a backup from a server
<code>encrypt</code>	Encrypt a file using master-key
<code>expunge</code>	Expunge a backup from a server
<code>info</code>	Information about a backup
<code>list-backup</code>	List the backups <b>for</b> a server
<code>mode</code>	Switch the mode <b>for</b> a server
<code>ping</code>	Check <b>if</b> pgmoneta is alive
<code>restore</code>	Restore a backup from a server
<code>retain</code>	Retain a backup from a server
<code>shutdown</code>	Shutdown pgmoneta
<code>status [details]</code>	Status of pgmoneta, with optional details
<code>verify</code>	Verify a backup from a server

pgmoneta: <https://pgmoneta.github.io/>

Report bugs: <https://github.com/pgmoneta/pgmoneta/issues>

## 9.1 backup

Backup a server

The command for a full backup is

```
pgmoneta-cli backup <server>
```

Example

```
pgmoneta-cli backup primary
```

The command for an incremental backup is

```
pgmoneta-cli backup <server> <identifier>
```

where the `identifier` is the identifier for a backup.

Example

```
pgmoneta-cli backup primary 20250101120000
```

## 9.2 list-backup

List the backups for a server

Command

```
pgmoneta-cli list-backup <server> [--sort asc|desc]
```

The `--sort` option allows sorting backups by timestamp: - `asc` for ascending order (oldest first) - `desc` for descending order (newest first)

Example

```
pgmoneta-cli list-backup primary
```

Example with sorting

```
pgmoneta-cli list-backup primary --sort desc
```

## 9.3 restore

Restore a backup from a server

Command

```
pgmoneta-cli restore <server> [<timestamp>|oldest|newest] [[current|name=X  
|xid=X|lsn=X|time=X|inclusive=X|timeline=X|action=X|primary|replica],*]  
<directory>
```

where

- `current` means copy the Write-Ahead Log (WAL ), and restore to first stable checkpoint
- `name=X` means copy the Write-Ahead Log (WAL ), and restore to the label specified
- `xid=X` means copy the Write-Ahead Log (WAL ), and restore to the XID specified
- `time=X` means copy the Write-Ahead Log (WAL ), and restore to the timestamp specified
- `lsn=X` means copy the Write-Ahead Log (WAL ), and restore to the Log Sequence Number (LSN) specified
- `inclusive=X` means that the restore is inclusive of the specified information
- `timeline=X` means that the restore is done to the specified information timeline
- `action=X` means which action should be executed after the restore (pause, shutdown)

More information

Example

```
pgmoneta-cli restore primary newest name=MyLabel,primary /tmp
```

## 9.4 verify

Verify a backup from a server

Command

```
pgmoneta-cli verify <server> <directory> [failed|all]
```

Example

```
pgmoneta-cli verify primary oldest /tmp
```

## 9.5 archive

Archive a backup from a server

Command

```
pgmoneta-cli archive <server> [<timestamp>|oldest|newest] [[current|name=X  
|xid=X|lsn=X|time=X|inclusive=X|timeline=X|action=X|primary|replica],*]  
<directory>
```

Example

```
pgmoneta-cli archive primary newest current /tmp
```

## 9.6 delete

Delete a backup from a server

Command

```
pgmoneta-cli delete <server> [<timestamp>|oldest|newest]
```

Example

```
pgmoneta-cli delete primary oldest
```

## 9.7 retain

Retain a backup from a server. The backup will not be deleted by the retention policy

Command

```
pgmoneta-cli retain [--cascade] <server> [<timestamp>|oldest|newest]
```

pgmoneta

---

Example

```
pgmoneta-cli retain primary oldest
```

## 9.8 expunge

Expunge a backup from a server. The backup will be deleted by the retention policy

Command

```
pgmoneta-cli expunge [--cascade] <server> [<timestamp>|oldest|newest]
```

Example

```
pgmoneta-cli expunge primary oldest
```

## 9.9 encrypt

Encrypt the file in place, remove unencrypted file after successful encryption.

Command

```
pgmoneta-cli encrypt <file>
```

## 9.10 decrypt

Decrypt the file in place, remove encrypted file after successful decryption.

Command

```
pgmoneta-cli decrypt <file>
```

## 9.11 compress

Compress the file in place, remove uncompressed file after successful compression.

Command

```
pgmoneta-cli compress <file>
```

## 9.12 decompress

Decompress the file in place, remove compressed file after successful decompression.

Command

```
pgmoneta-cli decompress <file>
```

## 9.13 info

Information about a backup.

Command

```
pgmoneta-cli info <server> <timestamp|oldest|newest>
```

## 9.14 ping

Verify if **pgmoneta** is alive

Command

```
pgmoneta-cli ping
```

Example

```
pgmoneta-cli ping
```

## 9.15 mode

**pgmoneta** detects when a server is down. You can bring a server online or offline using the mode command.

Command

```
pgmoneta-cli mode <server> <online|offline>
```

Example

```
pgmoneta-cli mode primary offline
```

or

```
pgmoneta-cli mode primary online
```

**pgmoneta** will keep basic services running for an offline server such that you can verify a backup or do a restore.

## 9.16 shutdown

Shutdown **pgmoneta**

Command

```
pgmoneta-cli shutdown
```

Example

```
pgmoneta-cli shutdown
```

## 9.17 status

Status of **pgmoneta**, with a `details` option

Command

```
pgmoneta-cli status [details]
```

Example

```
pgmoneta-cli status details
```

## 9.18 conf

Manage the configuration

Command

```
pgmoneta-cli conf [reload | ls | get | set]
```

Subcommand

- `reload`: Reload configuration
- `ls`: To print the configurations used
- `get <config_key>`: To obtain information about a runtime configuration value
- `set <config_key> <config_value>`: To modify the runtime configuration value

Example

```
pgmoneta-cli conf reload
pgmoneta-cli conf ls
pgmoneta-cli conf get server.primary.host
pgmoneta-cli conf set encryption aes-256-cbc
```

### 9.18.1 conf get

Get the value of a runtime configuration key, or the entire configuration.

- If you provide a `<config_key>`, you get the value for that key.
  - For main section keys, you can use either just the key (e.g., `host`) or with the section (e.g., `pgmoneta.host`).
  - For server section keys, use the server name as the section (e.g., `server.primary.host`, `server.myserver.port`).
- If you run `pgmoneta-cli conf get` without any key, the complete configuration will be output.

#### Examples

```
pgmoneta-cli conf get
pgmoneta-cli conf get host
pgmoneta-cli conf get pgmoneta.host
pgmoneta-cli conf get server.primary.host
pgmoneta-cli conf get server.myserver.port
```

#### ‘### conf set

Set the value of a runtime configuration parameter.

#### Syntax:

```
pgmoneta-cli conf set <config_key> <config_value>
```

#### Examples

```
# Logging and monitoring
pgmoneta-cli conf set log_level debug5
pgmoneta-cli conf set metrics 5001
pgmoneta-cli conf set management 5002

# Performance tuning
pgmoneta-cli conf set workers 4
pgmoneta-cli conf set backup_max_rate 1000000
pgmoneta-cli conf set compression zstd
```

```
# Retention policies
pgmoneta-cli conf set retention "14,2,6,1"
```

**Key Formats:** - **Main section parameters:** `key` or `pgmoneta.key` - Examples: `log_level`, `pgmoneta.metrics` - **Server section parameters:** `server.server_name.key` only - Examples: `server.primary.port`, `server.primary.host`

**Important Notes:** - Setting `metrics=0` or `management=0` disables those services - Invalid port numbers may show success but cause service failures (check server logs) - Server configuration uses format `server.name.parameter` (not `name.parameter`)

**Response Types:** - **Success (Applied):** Configuration change applied to running instance immediately - **Success (Restart Required):** Configuration change validated but requires manual update of configuration files AND restart - **Error:** Invalid key format, validation failure, or other errors

**Important: Restart Required Changes** When a configuration change requires restart, the change is only validated and stored temporarily in memory. To make the change permanent:

1. **Manually edit the configuration file** (e.g., `/etc/pgmoneta/pgmoneta.conf`)
2. **Restart pgmoneta** using `systemctl restart pgmoneta` or equivalent

**Warning:** Simply restarting pgmoneta without updating the configuration files will **revert** the change back to the file-based configuration.

**Example of Restart Required Process:**

```
# 1. Attempt to change host (requires restart)
pgmoneta-cli conf set host 192.168.1.100
# Output: Configuration change requires manual restart
#         Current value: localhost (unchanged in running instance)
#         Requested value: 192.168.1.100 (cannot be applied to live
#         instance)

# 2. Manually edit /etc/pgmoneta/pgmoneta.conf
sudo nano /etc/pgmoneta/pgmoneta.conf
# Change: host = localhost
# To:     host = 192.168.1.100

# 3. Restart pgmoneta
sudo systemctl restart pgmoneta

# 4. Verify the change
pgmoneta-cli conf get host
# Output: 192.168.1.100
```

**Why Manual File Editing is Required:** - `pgmoneta-cli conf set` only validates and temporarily stores restart-required changes - Configuration files are **not automatically updated** by the command -

On restart, pgmoneta always reads from the configuration files on disk - Without file updates, restart will revert to the original file-based values

## 9.19 clear

Clear data/statistics

Command

```
pgmoneta-cli clear [prometheus]
```

Subcommand

- **prometheus**: Reset the Prometheus statistics

Example

```
pgmoneta-cli clear prometheus
```

## 9.20 Shell completions

There is a minimal shell completion support for **pgmoneta-cli**.

Please refer to the Install pgmoneta tutorial for detailed information about how to enable and use shell completions.

## 10 Prometheus metrics

**pgmoneta** has the following Prometheus metrics.

### 10.1 pgmoneta\_state

The state of pgmoneta

### 10.2 pgmoneta\_version

The version of pgmoneta

Attribute	Description
version	The version of pgmoneta

### 10.3 pgmoneta\_logging\_info

The number of INFO logging statements

### 10.4 pgmoneta\_logging\_warn

The number of WARN logging statements

### 10.5 pgmoneta\_logging\_error

The number of ERROR logging statements

### 10.6 pgmoneta\_logging\_fatal

The number of FATAL logging statements

### 10.7 pgmoneta\_retention\_days

The retention days of pgmoneta

### **10.8 pgmoneta\_retention\_weeks**

The retention weeks of pgmoneta

### **10.9 pgmoneta\_retention\_months**

The retention months of pgmoneta

### **10.10 pgmoneta\_retention\_years**

The retention years of pgmoneta

### **10.11 pgmoneta\_retention\_server**

The retention of a server

Attribute	Description
name	The server identifier
parameter	The day, week, month or year

### **10.12 pgmoneta\_compression**

The compression used

### **10.13 pgmoneta\_used\_space**

The disk space used for pgmoneta

### **10.14 pgmoneta\_free\_space**

The free disk space for pgmoneta

### **10.15 pgmoneta\_total\_space**

The total disk space for pgmoneta

### 10.16 pgmoneta\_wal\_shipping

The disk space used for WAL shipping for a server

Attribute	Description
name	The server identifier

### 10.17 pgmoneta\_wal\_shipping\_used\_space

The disk space used for WAL shipping of a server

Attribute	Description
name	The server identifier

### 10.18 pgmoneta\_wal\_shipping\_free\_space

The free disk space for WAL shipping of a server

Attribute	Description
name	The server identifier

### 10.19 pgmoneta\_wal\_shipping\_total\_space

The total disk space for WAL shipping of a server

Attribute	Description
name	The server identifier

### 10.20 pgmoneta\_workspace

The disk space used for workspace for a server

Attribute	Description
name	The server identifier

### 10.21 pgmoneta\_workspace\_free\_space

The free disk space for workspace of a server

Attribute	Description
name	The server identifier

### 10.22 pgmoneta\_workspace\_total\_space

The total disk space for workspace of a server

Attribute	Description
name	The server identifier

### 10.23 pgmoneta\_hot\_standby

The disk space used for hot standby for a server

Attribute	Description
name	The server identifier

### 10.24 pgmoneta\_hot\_standby\_free\_space

The free disk space for hot standby of a server

Attribute	Description
name	The server identifier

### 10.25 pgmoneta\_hot\_standby\_total\_space

The total disk space for hot standby of a server

Attribute	Description
name	The server identifier

### 10.26 pgmoneta\_server\_timeline

The current timeline a server is on

Attribute	Description
name	The server identifier

### 10.27 pgmoneta\_server\_parent\_tli

The parent timeline of a timeline on a server

Attribute	Description
name	The server identifier
tli	

### 10.28 pgmoneta\_server\_timeline\_switchpos

The WAL switch position of a timeline on a server (showed in hex as a parameter)

Attribute	Description
name	The server identifier
tli	
walpos	

### 10.29 pgmoneta\_server\_workers

The number of workers for a server

Attribute	Description
name	The server identifier

### 10.30 pgmoneta\_server\_online

Is the server online ?

Attribute	Description
name	The server identifier

### 10.31 pgmoneta\_server\_primary

Is the server a primary ?

Attribute	Description
name	The server identifier

### 10.32 pgmoneta\_server\_valid

Is the server in a valid state

Attribute	Description
name	The server identifier

### 10.33 pgmoneta\_wal\_streaming

The WAL streaming status of a server

Attribute	Description
name	The server identifier

### 10.34 pgmoneta\_server\_operation\_count

The count of client operations of a server

Attribute	Description
name	The server identifier

### 10.35 pgmoneta\_server\_failed\_operation\_count

The count of failed client operations of a server

Attribute	Description
name	The server identifier

### 10.36 pgmoneta\_server\_last\_operation\_time

The time of the latest client operation of a server

Attribute	Description
name	The server identifier

### 10.37 pgmoneta\_server\_last\_failed\_operation\_time

The time of the latest failed client operation of a server

Attribute	Description
name	The server identifier

### 10.38 pgmoneta\_server\_checksums

Are checksums enabled

Attribute	Description
name	The server identifier

### 10.39 pgmoneta\_server\_summarize\_wal

Is summarize\_wal enabled

Attribute	Description
name	The server identifier

### 10.40 pgmoneta\_server\_extensions\_detected

The number of extensions detected on server

Attribute	Description
name	The server identifier

### 10.41 pgmoneta\_server\_extension

Information about installed extensions on server

Attribute	Description
name	The server identifier
extension	The name of the extension
version	The version of the extension
comment	Description of the extension's functionality

## 10.42 pgmoneta\_extension\_pgmoneta\_ext

Status of the pgmoneta extension

Attribute	Description
name	The server identifier
version	The version of the pgmoneta extension (or “not_installed” if not present)

## 10.43 pgmoneta\_backup\_oldest

The oldest backup for a server

Attribute	Description
name	The server identifier

## 10.44 pgmoneta\_backup\_newest

The newest backup for a server

Attribute	Description
name	The server identifier

## 10.45 pgmoneta\_backup\_valid

The number of valid backups for a server

Attribute	Description
name	The server identifier

**10.46 pgmoneta\_backup\_invalid**

The number of invalid backups for a server

Attribute	Description
name	The server identifier

**10.47 pgmoneta\_backup**

Is the backup valid for a server

Attribute	Description
name	The server identifier
label	The backup label

**10.48 pgmoneta\_backup\_version**

The version of postgresql for a backup

Attribute	Description
name	The server identifier
label	The backup label
major	The PostgreSQL major version
minor	The PostgreSQL minor version

**10.49 pgmoneta\_backup\_total\_elapsed\_time**

The backup in seconds for a server

Attribute	Description
name	The server identifier

Attribute	Description
label	The backup label

### 10.50 pgmoneta\_backup\_basebackup\_elapsed\_time

The duration for basebackup in seconds for a server

Attribute	Description
name	The server identifier
label	The backup label

### 10.51 pgmoneta\_backup\_manifest\_elapsed\_time

The duration for manifest in seconds for a server

Attribute	Description
name	The server identifier
label	The backup label

### 10.52 pgmoneta\_backup\_compression\_zstd\_elapsed\_time

The duration for zstd compression in seconds for a server

Attribute	Description
name	The server identifier
label	The backup label

### 10.53 pgmoneta\_backup\_compression\_gzip\_elapsed\_time

The duration for gzip compression in seconds for a server

Attribute	Description
name	The server identifier
label	The backup label

#### 10.54 pgmoneta\_backup\_compression\_bzip2\_elapsed\_time

The duration for bzip2 compression in seconds for a server

Attribute	Description
name	The server identifier
label	The backup label

#### 10.55 pgmoneta\_backup\_compression\_lz4\_elapsed\_time

The duration for lz4 compression in seconds for a server

Attribute	Description
name	The server identifier
label	The backup label

#### 10.56 pgmoneta\_backup\_encryption\_elapsed\_time

The duration for encryption in seconds for a server

Attribute	Description
name	The server identifier
label	The backup label

**10.57 pgmoneta\_backup\_linking\_elapsed\_time**

The duration for linking in seconds for a server

Attribute	Description
name	The server identifier
label	The backup label

**10.58 pgmoneta\_backup\_remote\_ssh\_elapsed\_time**

The duration for remote ssh in seconds for a server

Attribute	Description
name	The server identifier
label	The backup label

**10.59 pgmoneta\_backup\_remote\_s3\_elapsed\_time**

The duration for remote\_s3 in seconds for a server

Attribute	Description
name	The server identifier
label	The backup label

**10.60 pgmoneta\_backup\_remote\_azure\_elapsed\_time**

The duration for remote\_azure in seconds for a server

Attribute	Description
name	The server identifier
label	The backup label

### 10.61 pgmoneta\_backup\_start\_timeline

The starting timeline of a backup for a server

Attribute	Description
name	The server identifier
label	The backup label

### 10.62 pgmoneta\_backup\_end\_timeline

The ending timeline of a backup for a server

Attribute	Description
name	The server identifier
label	The backup label

### 10.63 pgmoneta\_backup\_start\_walpos

The starting WAL position of a backup for a server

Attribute	Description
name	The server identifier
label	The backup label
walpos	The WAL position

### 10.64 pgmoneta\_backup\_checkpoint\_walpos

The checkpoint WAL position of a backup for a server

Attribute	Description
name	The server identifier

Attribute	Description
label	The backup label
walpos	The WAL position

### 10.65 pgmoneta\_backup\_end\_walpos

The ending WAL position of a backup for a server

Attribute	Description
name	The server identifier
label	The backup label
walpos	The WAL position

### 10.66 pgmoneta\_restore\_newest\_size

The size of the newest restore for a server

Attribute	Description
name	The server identifier

### 10.67 pgmoneta\_backup\_newest\_size

The size of the newest backup for a server

Attribute	Description
name	The server identifier

### 10.68 pgmoneta\_restore\_size

The size of a restore for a server

Attribute	Description
name	The server identifier
label	The backup label

### 10.69 pgmoneta\_restore\_size\_increment

The size increment of a restore for a server

Attribute	Description
name	The server identifier
label	The backup label

### 10.70 pgmoneta\_backup\_size

The size of a backup for a server

Attribute	Description
name	The server identifier
label	The backup label

### 10.71 pgmoneta\_backup\_compression\_ratio

The ratio of backup size to restore size for each backup

Attribute	Description
name	The server identifier
label	The backup label

### 10.72 pgmoneta\_backup\_throughput

The throughput of the backup for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

### 10.73 pgmoneta\_backup\_basebackup\_mbs

The throughput of the basebackup for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

### 10.74 pgmoneta\_backup\_manifest\_mbs

The throughput of the manifest for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

### 10.75 pgmoneta\_backup\_compression\_zstd\_mbs

The throughput of the zstd compression for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

**10.76 pgmoneta\_backup\_compression\_gzip\_mbs**

The throughput of the gzip compression for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

**10.77 pgmoneta\_backup\_compression\_bzip2\_mbs**

The throughput of the bzip2 compression for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

**10.78 pgmoneta\_backup\_compression\_lz4\_mbs**

The throughput of the lz4 compression for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

**10.79 pgmoneta\_backup\_encryption\_mbs**

The throughput of the encryption for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

### 10.80 pgmoneta\_backup\_linking\_mbs

The throughput of the linking for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

### 10.81 pgmoneta\_backup\_remote\_ssh\_mbs

The throughput of the remote\_ssh for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

### 10.82 pgmoneta\_backup\_remote\_s3\_mbs

The throughput of the remote\_s3 for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

### 10.83 pgmoneta\_backup\_remote\_azure\_mbs

The throughput of the remote\_azure for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

### 10.84 pgmoneta\_backup\_retain

Retain backup for a server

Attribute	Description
name	The server identifier
label	The backup label

### 10.85 pgmoneta\_backup\_total\_size

The total size of the backups for a server

Attribute	Description
name	The server identifier

### 10.86 pgmoneta\_wal\_total\_size

The total size of the WAL for a server

Attribute	Description
name	The server identifier

### 10.87 pgmoneta\_total\_size

The total size for a server

Attribute	Description
name	The server identifier

**10.88 pgmoneta\_active\_backup**

Is there an active backup for a server

Attribute	Description
name	The server identifier

**10.89 pgmoneta\_active\_restore**

Is there an active restore for a server

Attribute	Description
name	The server identifier

**10.90 pgmoneta\_active\_archive**

Is there an active archiving for a server

Attribute	Description
name	The server identifier

**10.91 pgmoneta\_active\_delete**

Is there an active delete for a server

Attribute	Description
name	The server identifier

**10.92 pgmoneta\_active\_retention**

Is there an active archiving for a server

Attribute	Description
name	The server identifier

### 10.93 pgmoneta\_current\_wal\_file

The current streaming WAL filename of a server

Attribute	Description
name	The server identifier
file	The WAL file name

### 10.94 pgmoneta\_current\_wal\_lsn

The current WAL log sequence number

Attribute	Description
name	The server identifier
lsn	The Logical Sequence Number

## 11 SSH

### 11.1 Prerequisites

First of all, you need to have a remote server where you can store your backups on.

Lets take an EC2 instance as an example, after launching an EC2 instance you need to add new user account with SSH access to the EC2 instance:

1. Connect to your Linux instance using SSH.
2. Use the `adduser` command to add a new user account to an EC2 instance (replace `new_user` with the new account name).

```
sudo adduser new_user --disabled-password
```

3. Change the security context to the `new_user` account so that folders and files you create have the correct permissions:

```
sudo su - new_user
```

4. Create a `.ssh` directory in the `new_user` home directory and use the `chmod` command to change the `.ssh` directory's permissions to 700:

```
mkdir .ssh && chmod 700 .ssh
```

5. Use the `touch` command to create the `authorized_keys` file in the `.ssh` directory and use the `chmod` command to change the `.ssh/authorized_keys` file permissions to 600:

```
touch .ssh/authorized_keys && chmod 600 .ssh/authorized_keys
```

6. Retrieve the public key for the key pair in your local computer:

```
cat ~/.ssh/id_rsa.pub
```

7. In the EC2 instance, run the `cat` command in append mode:

```
cat >> .ssh/authorized_keys
```

8. Paste the public key into the `.ssh/authorized_keys` file and then press Enter.
9. Press and hold `Ctrl+d` to exit `cat` and return to the command line session prompt.

To verify that the new user can use SSH to connect to the EC2 instance, run the following command from a command line prompt on your local computer:

```
ssh new_user@public_dns_name_of_EC2_instance
```

## 11.2 Modify the pgmoneta configuration

You need to create a directory on your remote server where backups can be stored in.

In addition, your local computer needs to have a storage space for 1 backup.

Change `pgmoneta.conf` to add

```
storage_engine = ssh
ssh_hostname = your-public_dns_name_of_EC2_instance
ssh_username = new_user
ssh_base_dir = the-path-of-the-directory-where-backups-stored-in
```

under the `[pgmoneta]` section.

## 12 Azure

### 12.1 Prerequisites

First of all, you need to have an Azure account, an Azure storage account and a blob container.

A container organizes a set of blobs, similar to a directory in a file system. A storage account can include an unlimited number of containers, and a container can store an unlimited number of blobs.

To create an Azure storage account with the Azure portal:

1. Sign in to the Azure portal.
2. From the left portal menu, select Storage accounts to display a list of your storage accounts. If the portal menu isn't visible, click the menu button to toggle it on.
3. On the Storage accounts page, select Create.
4. On the Basics tab, provide a resource group name and storage account name. You can go for the default settings of the other fields.
5. Choose Next: Advanced.
6. On the Advanced tab, you can configure additional options and modify default settings for your new storage account. You can go for the default settings.
7. Choose Next: Networking.
8. On the Networking tab, you can go for the default settings.
9. Choose Next: Data protection.
10. On the Data protection tab, you can for the default settings.
11. Choose Next: Encryption.
12. On the Encryption tab, you can for the default settings.
13. Choose Next: Tags.
14. Choose Next: Review to see all of the choices you made up to this point. When you are ready to proceed, choose Create.

To create a blob container with the Azure portal:

1. In the navigation pane for the storage account, scroll to the [Data storage](#) section and select Containers.
2. Within the Containers pane, select the + [Container](#) button to open the New container pane.

3. Within the New Container pane, provide a Name for your new container.
4. Select Create to create the container.

To get the Azure storage account shared key which is required for pgmoneta configuration:

1. In the navigation pane for the storage account, scroll to the **Security + networking** section and select Access Keys.
2. Under key1, find the Key value. Select the Copy button to copy the account key.

You can use either of the two keys to access Azure Storage, but in general it's a good practice to use the first key, and reserve the use of the second key for when you are rotating keys.

## 12.2 Modify the pgmoneta configuration

You need to have a storage space for 1 backup on your local computer.

Change `pgmoneta.conf` to add

```
storage_engine = azure
azure_storage_account = the-storage-account-name
azure_container = the-container-name
azure_shared_key = the-storage-account-shared-key
azure_base_dir = directory-where-backups-will-be-stored-in
```

under the `[pgmoneta]` section.

## 13 S3

### 13.1 Prerequisites

First of all, you need to have an AWS account, an IAM user and S3 bucket.

To create an IAM user:

1. Sign in to the AWS Management Console and open the IAM console.
2. In the navigation pane, choose Users and then choose Add users.
3. Type the user name for the new user.
4. Select the type of access to be both programmatic access and access to the AWS Management Console.
5. Choose Next: Permissions.
6. On the Set permissions page, select attach existing policies directly, search for AmazonS3FullAccess and choose it, then choose Next: Review, then choose Add permissions.
7. Choose Next: Tags.
8. Choose Next: Review to see all of the choices you made up to this point. When you are ready to proceed, choose Create user.
9. To view the users' access keys (access key IDs and secret access keys), choose Show next to each password and access key that you want to see. To save the access keys, choose Download .csv and then save the file to a safe location.

You are now ready to create a S3 bucket, To create a S3 bucket:

1. Sign in to the AWS Management Console using your IAM user credentials and open the Amazon S3 console.
2. Choose Create bucket.
3. In Bucket name, enter a name for your bucket.
4. In Region, choose the AWS Region where you want the bucket to reside.
5. Keep the default values as it is and Choose Create bucket.

### 13.2 Modify the pgmoneta configuration

You need to have a storage space for 1 backup on your local computer.

Change `pgmoneta.conf` to add

```
storage_engine = s3
s3_aws_region = the-aws-region
s3_access_key_id = your-access-key-id-from-the-downloaded-file
s3_secret_access_key = your-secret-access-key-from-the-downloaded-file
s3_bucket = your-s3-bucket-name
s3_base_dir = directory-where-backups-will-be-stored-in
```

under the `[pgmoneta]` section.

## 14 Running pgmoneta with Docker

You can run `pgmoneta` using Docker instead of compiling it manually.

### 14.1 Prerequisites

- **Docker** or **Podman** must be installed on the server where PostgreSQL is running.
  - Ensure PostgreSQL is configured to allow external connections.
- 

### 14.2 Step 1: Enable External PostgreSQL Access

Modify the local PostgreSQL server's `postgresql.conf` file to allow connections from outside:

```
listen_addresses = '*'
```

Update `pg_hba.conf` to allow remote connections:

```
host    all    all    0.0.0.0/0    scram-sha-256
```

Then, restart PostgreSQL for the changes to take effect:

```
sudo systemctl restart postgresql
```

---

### 14.3 Step 2: Clone the Repository

```
git clone https://github.com/pgmoneta/pgmoneta.git
cd pgmoneta
```

## 14.4 Step 3: Build the Docker Image

There are two Dockerfiles available: 1. **Alpine-based image**

**Using Docker** `sh docker build -t pgmoneta:latest -f ./contrib/docker/Dockerfile.alpine .` **Using Podman** `sh podman build -t pgmoneta:latest -f ./contrib/docker/Dockerfile.alpine .`

### 2. Rocky Linux 9-based image

```
docker build -t pgmoneta:latest -f ./contrib/docker/Dockerfile.rocky9 .
```

#### Using Podman

```
podman build -t pgmoneta:latest -f ./contrib/docker/Dockerfile.rocky9 .
```

---

## 14.5 Step 4: Run pgmoneta as a Docker Container

Once the image is built, run the container using: - **Using Docker** `sh docker run -d --name pgmoneta --network host pgmoneta:latest` - **Using Podman** `sh podman run -d --name pgmoneta --network host pgmoneta:latest`

---

## 14.6 Step 5: Verify the Container

Check if the container is running:

- **Using Docker** `sh docker ps | grep pgmoneta`
- **Using Podman** `sh podman ps | grep pgmoneta`

Check logs for any errors: - **Using Docker** `sh docker logs pgmoneta` - **Using Podman** `sh podman logs pgmoneta`

You can also inspect the exposed server at:

```
http://localhost:5001/
```

## 15 Troubleshooting

### 15.1 Could not get version for server

If you get this `FATAL` during startup check your PostgreSQL logins

```
psql postgres
```

and

```
psql -U repl postgres
```

And, check the PostgreSQL logs for any error.

Setting `log_level` to `DEBUG5` in `pgmoneta.conf` could provide more information about the error.

## 16 Acknowledgement

### 16.1 Authors

## 16.3 Contributing

Contributions to **pgmoneta** are managed on GitHub

- Ask a question
- Raise an issue
- Feature request
- Code submission

Contributions are most welcome!

Please, consult our Code of Conduct policies for interacting in our community.

Consider giving the project a star on GitHub if you find it useful. And, feel free to follow the project on X as well.
