1 Introduction

pgmoneta is a backup / restore solution for PostgreSQL.

Ideally, you would not need to do backups and disaster recovery, but that isn't how the real World works.

Possible scenarios that could happen

- Data corruption
- · System failure
- Human error
- · Natural disaster

and then it is up to the database administrator to get the database system back on-line, and to the correct recovery point.

Two key factors are

- Recovery Point Objective (RPO): Maximum targeted period in which data might be lost from an IT service due to a major incident
- Recovery Time Objective (RTO): The targeted duration of time and a service level within which a
 business process must be restored after a disaster (or disruption) in order to avoid unacceptable
 consequences associated with a break in business continuity

You would like to have both of these as close to zero as possible, since RPO of 0 means that you won't lose data, and RTO of 0 means that your system recovers at once. However, that is easier said than done.

pgmoneta is focused on having features that will allow database systems to get as close to these goals as possible such that high availability of 99.99% or more can be implemented, and monitored through standard tools.

pgmoneta is named after the Roman Goddess of Memory.

1.1 Features

- · Full backup
- Restore
- Compression (gzip, zstd, lz4, bzip2)
- · AES encryption support
- · Symlink support
- WAL shipping support

- Hot standby
- Prometheus support
- Remote management
- Offline mode
- Transport Layer Security (TLS) v1.2+ support
- Daemon mode
- User vault

1.2 Platforms

The supported platforms are

- Fedora 38+
- RHEL 9
- RockyLinux 9
- FreeBSD
- OpenBSD

2 Installation

2.1 Fedora

You need to add the PostgreSQL YUM repository, for example for Fedora 40

```
dnf install -y https://download.postgresql.org/pub/repos/yum/reporpms/F
    -40-x86_64/pgdg-fedora-repo-latest.noarch.rpm
```

and do the install via

```
dnf install -y pgmoneta
```

Additional information

- PostgreSQL YUM
- Linux downloads

2.2 RHEL 9 / RockyLinux 9

x86_64

```
dnf install -y https://dl.fedoraproject.org/pub/epel/epel-release-latest
    -9.noarch.rpm
dnf install -y https://download.postgresql.org/pub/repos/yum/reporpms/EL
    -9-x86_64/pgdg-redhat-repo-latest.noarch.rpm
```

aarch64

```
dnf install -y https://dl.fedoraproject.org/pub/epel/epel-release-latest
    -9.noarch.rpm
dnf install -y https://download.postgresql.org/pub/repos/yum/reporpms/EL
    -9-aarch64/pgdg-redhat-repo-latest.noarch.rpm
```

and do the install via

```
dnf install -y pgmoneta
```

2.3 Compiling the source

We recommend using Fedora to test and run **pgmoneta**, but other Linux systems, FreeBSD and MacOS are also supported.

pgmoneta requires

- clang
- cmake
- make
- libev
- OpenSSL
- zlib
- zstd
- Iz4
- bzip2
- systemd
- rst2man
- libssh
- libcurl
- libarchive

```
dnf install git gcc clang clang-analyzer cmake make libev libev-devel \
    openssl openssl-devel \
    systemd systemd-devel zlib zlib-devel \
    libzstd libzstd-devel \
    lz4 lz4-devel libssh libssh-devel \
    libcurl libcurl-devel \
    python3-docutils libatomic \
    bzip2 bzip2-devel \
    libarchive libarchive-devel
```

Alternative gcc can be used.

2.3.1 RHEL / RockyLinux

On RHEL / Rocky, before you install the required packages some additional repositories need to be enabled or installed first.

First you need to install the subscription-manager

```
dnf install subscription-manager
```

It is ok to disregard the registration and subscription warning.

Otherwise, if you have a Red Hat corporate account (you need to specify the company/organization name in your account), you can register using

```
subscription-manager register --username <your-account-email-or-login> --
password <your-password> --auto-attach
```

Then install the EPEL repository,

```
dnf install epel-release
```

Then to enable powertools

Then use the dnf command for **pgmoneta** to install the required packages.

2.3.2 FreeBSD

On FreeBSD, pkg is used instead of dnf or yum.

Use pkg install <package name > to install the following packages

```
git gcc cmake libev openssl libssh zlib-ng zstd liblz4 bzip2 curl \ py39-docutils libarchive
```

2.3.3 Build

2.3.3.1 Release build The following commands will install **pgmoneta** in the /usr/local hierarchy.

```
git clone https://github.com/pgmoneta/pgmoneta.git

cd pgmoneta

mkdir build

cd build

cmake -DCMAKE_INSTALL_PREFIX=/usr/local ..

make

sudo make install
```

See RPM for how to build a RPM of **pgmoneta**.

2.3.3.2 Debug build The following commands will create a DEBUG version of **pgmoneta**.

```
git clone https://github.com/pgmoneta/pgmoneta.git
cd pgmoneta
mkdir build
cd build
cmake -DCMAKE_C_COMPILER=clang -DCMAKE_BUILD_TYPE=Debug ..
make
```

You can do

```
cmake -DCMAKE_C_COMPILER=clang -DCMAKE_BUILD_TYPE=Debug -DCMAKE_C_FLAGS="-
DCORE_DEBUG" ..
```

in order to get information from the core libraries too.

2.4 Compiling the documentation

pgmoneta's documentation requires

- pandoc
- texlive

```
dnf install pandoc texlive-scheme-basic \
    'tex(footnote.sty)' 'tex(footnotebackref.sty)' \
    'tex(pagecolor.sty)' 'tex(hardwrap.sty)' \
    'tex(mdframed.sty)' 'tex(sourcesanspro.sty)' \
    'tex(lylenc.def)' 'tex(sourcecodepro.sty)' \
    'tex(titling.sty)' 'tex(csquotes.sty)' \
    'tex(zref-abspage.sty)' 'tex(needspace.sty)'
```

You will need the Eisvogel template as well which you can install through

```
wget https://github.com/Wandmalfarbe/pandoc-latex-template/releases/
    download/v3.1.0/Eisvogel-3.1.0.tar.gz
tar -xzf Eisvogel-3.1.0.tar.gz
mkdir -p $HOME/.local/share/pandoc/templates
mv Eisvogel-3.1.0/eisvogel.latex $HOME/.local/share/pandoc/templates
```

where \$HOME is your home directory.

2.4.0.1 Generate API guide This process is optional. If you choose not to generate the API HTML files, you can opt out of downloading these dependencies, and the process will automatically skip the generation.

Download dependencies

```
dnf install graphviz doxygen
```

2.4.1 Build

These packages will be detected during cmake and built as part of the main build.

2.5 Extension installation

When you configure the extra parameter in the server section of pgmoneta.conf, it requires the server side to have the pgmoneta_ext extension installed to make it work.

The following instructions can help you easily install pgmoneta_ext. If you encounter any problems, please refer to the more detailed instructions in the DEVELOPERS documentation.

2.5.1 Install pgmoneta_ext

After you have successfully installed pgmoneta, the following commands will help you install pgmoneta_ext:

```
dnf install -y pgmoneta_ext
```

You need to add the pgmoneta_ext library for PostgreSQL in postgrersql.conf as well:

```
shared_preload_libraries = 'pgmoneta_ext'
```

And remember to restart PostgreSQL to make it work.

2.5.2 Verify success

You can use the postgres role to test.

1. Log into PostgreSQL

```
psql
```

2. Create a new test database

```
CREATE DATABASE testdb;
```

3. Enter the database

```
\c testdb
```

4. Follow the SQL commands below to check the function

```
DROP EXTENSION IF EXISTS pgmoneta_ext;
CREATE EXTENSION pgmoneta_ext;
SELECT pgmoneta_ext_version();
```

You should see

```
pgmoneta_ext_version
------
0.1.0
(1 row)
```

2.5.3 Granting SUPERUSER Privileges

Some functions in pgmoneta_ext require SUPERUSER privileges. To enable these, grant the repl role superuser privileges using the command below. **Please proceed with caution**: granting superuser privileges bypasses all permission checks, allowing unrestricted access to the database, which can pose security risks. We are committed to enhancing privilege security in future updates.

```
ALTER ROLE repl WITH SUPERUSER;
```

To revoke superuser privileges from the repl role, use the following command:

```
ALTER ROLE repl WITH NOSUPERUSER;
```

3 Quick start

Make sure that **pgmoneta** is installed and in your path by using pgmoneta -?. You should see

```
pgmoneta 0.16.1
  Backup / restore solution for PostgreSQL
Usage:
 pgmoneta [ -c CONFIG_FILE ] [ -u USERS_FILE ] [ -d ]
Options:
 -c, --config CONFIG_FILE
                                                   Set the path to the
    pgmoneta.conf file
 -h, --host HOST
                                                  Set the host name
 -p, --port PORT
                                                   Set the port number
 -U, --user USERNAME
                                                  Set the user name
 -P, --password PASSWORD
                                                  Set the password
 -L, --logfile FILE -v, --verbose
                                                  Set the log file
                                                  Output text string of
     result
 -V, --version
                                                  Display version
     information
 -F, --format text|json|raw
                                                  Set the output format
 -C, --compress none|gz|zstd|lz4|bz2
                                                  Compress the wire
  -E, --encrypt none aes aes256 aes192 aes128
                                                  Encrypt the wire
    protocol
 -?, --help
                                                   Display help
Commands:
 annotate
                           Annotate a backup with comments
 archive
                           Archive a backup from a server
 backup
                           Backup a server
 clear <what>
                           Clear data, with:
                           - 'prometheus' to reset the Prometheus
                              statistics
                           Compress a file using configured method
 compress
 conf <action>
                           Manage the configuration, with one of
     subcommands:
                           - 'get' to obtain information about a runtime
                              configuration value

 verify
pgmoneta: https://pgmoneta.github.io/
Report bugs: https://github.com/pgmoneta/pgmoneta/issues
```

If you encounter any issues following the above steps, you can refer to the **Installation** chapter to see how to install or compile pgmoneta on your system.

3.1 Configuration

Lets create a simple configuration file called pgmoneta.conf with the content

```
[pgmoneta]
host = *
metrics = 5001

base_dir = /home/pgmoneta

compression = zstd

retention = 7

log_type = file
log_level = info
log_path = /tmp/pgmoneta.log

unix_socket_dir = /tmp/

[primary]
host = localhost
port = 5432
user = repl
wal_slot = repl
```

In our main section called [pgmoneta] we setup **pgmoneta** to listen on all network addresses. We will enable Prometheus metrics on port 5001 and have the backups live in the /home/pgmoneta directory. All backups are being compressed with zstd and kept for 7 days. Logging will be performed at info level and put in a file called /tmp/pgmoneta.log. Last we specify the location of the unix_socket_dir used for management operations and the path for the PostgreSQL command

line tools.

Next we create a section called [primary] which has the information about our PostgreSQL instance. In this case it is running on localhost on port 5432 and we will use the repl user account to connect, and the Write+Ahead slot will be named repl as well.

The repl user must have the REPLICATION role and have access to the postgres database, so for example

```
CREATE ROLE repl WITH LOGIN REPLICATION PASSWORD 'secretpassword';
```

and in pg_hba.conf

```
local postgres
                   repl
                                        scram-sha-256
                         127.0.0.1/32
host postgres
                   repl
                                        scram-sha-256
host postgres
                   repl
                          ::1/128
                                       scram-sha-256
host replication
                          127.0.0.1/32
                                       scram-sha-256
                   repl
host
     replication
                   repl
                          ::1/128
                                        scram-sha-256
```

The authentication type should be based on postgresql.conf's password_encryption value.

Then, create a physical replication slot that will be used for Write-Ahead Log streaming, like

```
SELECT pg_create_physical_replication_slot('repl', true, false);
```

Alternatively, configure automatically slot creation by adding create_slot = yes to [pgmoneta] or corresponding server section.

We will need a user vault for the repl account, so the following commands will add a master key, and the repl password. The master key should be longer than 8 characters.

```
pgmoneta-admin master-key
pgmoneta-admin -f pgmoneta_users.conf user add
```

For scripted use, the master key and user password can be provided using the PGMONETA_PASSWORD environment variable.

We are now ready to run **pgmoneta**.

See the **Configuration** charpter for all configuration options.

3.2 Running

We will run **pgmoneta** using the command

```
pgmoneta -c pgmoneta.conf -u pgmoneta_users.conf
```

If this doesn't give an error, then we are ready to do backups.

pgmoneta is stopped by pressing Ctrl-C (^C) in the console where you started it, or by sending the SIGTERM signal to the process using kill <pid>.

3.3 Run-time administration

pgmoneta has a run-time administration tool called pgmoneta-cli.

You can see the commands it supports by using pgmoneta-cli -? which will give

```
pgmoneta-cli 0.12.0
  Command line utility for pgmoneta
Usage:
  pgmoneta-cli [ -c CONFIG_FILE ] [ COMMAND ]
Options:
  -c, --config CONFIG_FILE
                                                   Set the path to the
     pgmoneta.conf file
  -h, --host HOST
                                                   Set the host name
 -p, --port PORT
                                                   Set the port number
 -U, --user USERNAME
                                                   Set the user name
  -P, --password PASSWORD
                                                   Set the password
 -L, --logfile FILE -v, --verbose
                                                   Set the log file
                                                   Output text string of
     result
  -V, --version
                                                   Display version
     information
  -F, --format text|json|raw
                                                   Set the output format
  -C, --compress none gz zstd lz4 bz2
                                                   Compress the wire
     protocol
  -E, --encrypt none aes aes256 aes192 aes128
                                                  Encrypt the wire
     protocol
  -?, --help
                                                   Display help
Commands:
 backup
                           Backup a server
 list-backup
                           List the backups for a server
                           Restore a backup from a server
  restore
                           Verify a backup from a server
 verify
                           Archive a backup from a server
 archive
 delete
                           Delete a backup from a server
 retain
                           Retain a backup from a server
                           Expunge a backup from a server
 expunge
 encrypt
                           Encrypt a file using master-key
                           Decrypt a file using master-key
 decrypt
                           Check if pgmoneta is alive
 ping
 shutdown
                           Shutdown pgmoneta
```

```
status [details]

conf <action>
    subcommands:

- 'reload' to reload the configuration

clear <what>

Clear data, with:

- 'prometheus' to reset the Prometheus

statistics
```

This tool can be used on the machine running **pgmoneta** to do a backup like

```
pgmoneta-cli -c pgmoneta.conf backup primary
```

A restore would be

```
pgmoneta-cli -c pgmoneta.conf restore primary <timestamp> /path/to/restore
```

To shutdown pgmoneta you would use

```
pgmoneta-cli -c pgmoneta.conf shutdown
```

Check the outcome of the operations by verifying the exit code, like

```
echo $?
```

or by using the -v flag.

If pgmoneta has both Transport Layer Security (TLS) and management enabled then pgmoneta-cli can connect with TLS using the files ~/.pgmoneta/pgmoneta.key (must be 0600 permission), ~/.pgmoneta/pgmoneta.crt and ~/.pgmoneta/root.crt.

3.4 Administration

pgmoneta has an administration tool called pgmoneta-admin, which is used to control user registration with **pgmoneta**.

You can see the commands it supports by using pgmoneta-admin -? which will give

```
-l, --length
                          Password length
 -V, --version
-?, --help
                          Display version information
                          Display help
Commands:
 master-key
                          Create or update the master key
  user <subcommand>
                          Manage a specific user, where <subcommand> can
     be
                          - add to add a new user
                          - del to remove an existing user
                          - edit to change the password for an existing
                              user
                          - ls to list all available users
```

In order to set the master key for all users you can use

```
pgmoneta-admin -g master-key
```

The master key must be at least 8 characters.

Then use the other commands to add, update, remove or list the current user names, f.ex.

```
pgmoneta-admin -f pgmoneta_users.conf user add
```

3.5 Next Steps

Next steps in improving pgmoneta's configuration could be

- Update pgmoneta.conf with the required settings for your system
- Enable Transport Layer Security v1.2+ (TLS) for administrator access

See Configuration for more information on these subjects.

4 Configuration

The configuration is loaded from either the path specified by the -c flag or /etc/pgmoneta/pgmoneta.conf.

The configuration of **pgmoneta** is split into sections using the [and] characters.

The main section, called [pgmoneta], is where you configure the overall properties of **pgmoneta**.

Other sections doesn't have any requirements to their naming so you can give them meaningful names like [primary] for the primary PostgreSQL instance.

All properties are in the format key = value.

The characters # and; can be used for comments; must be the first character on the line.

The Bool data type supports the following values: on, yes, 1, **true**, off, no, 0 and **false**.

See a sample configuration for running **pgmoneta** on localhost.

4.1 pgmoneta

Property	Default	Unit	Required	Description
host		String	Yes	The bind address for pgmoneta
unix_socket_dir		String	Yes	The Unix Domain Socket location
base_dir		String	Yes	The base directory for the backup
metrics	0	Int	No	The metrics port (disable = 0)

Property	Default	Unit	Required	Description
metrics_cache_max_age	0	String	No	The time to keep a Prometheus (metrics) response ir cache. If this value is specified without units, it is taken as seconds. Setting this parameter to 0 disables caching. It supports the following units as suffixes: 'S' for seconds (default), 'M for minutes, 'H' for hours, 'D' for days, and 'W' for weeks.

Property	Default	Unit	Required	Description
Figherty	Delault	Offic	Required	
metrics_cache_max_size	256k	String	No	The maximum amount of data to keep in cache when serving Prometheus responses. Changes require restart. This parameter determines the size of memory allocated for the cache even if metrics_cache_materics are disabled. Its value, however, is taken into account only if metrics_cache_materics_
management	0	Int	No	The remote management port (disable = 0)
compression	zstd	String	No	The compression type (none, gzip, client-gzip, server-gzip, zstd, client-zstd, server-zstd, lz4, client-lz4, server-lz4, bzip2, client-bzip2)

Property	Default	Unit	Required	Description
compression_level	3	Int	No	The compression level
workers	0	Int	No	The number of workers that each process can use for its work. Use 0 to disable. Maximum is CPU count
workspace		/tmp/pgmor &tira ing workspace/		The directory for the workspace that incremental backup can use for its work
storage_engine	local	String	No	The storage engine type (local, ssh, s3, azure)

Property	Default	Unit	Required	Description
encryption	none	String	No	The encryption mode for encrypt wal and data none: No encryption aes or aes-256 or aes-256-cbc: AES CBC (Cipher Block Chaining) mode with 256 bit key length aes-192 or aes-192-cbc: AES CBC mode with 192 bit key length aes-128 or aes-128-cbc: AES CBC mode with 128 bit key length aes-256-ctr: AES CTR (Counter) mode with 256 bit key length aes-192-ctr: AES CTR mode with 192 bit key length aes-192-ctr: AES CTR mode with 192 bit key length aes-128-ctr: AES CTR mode with 192 bit key length aes-128-ctr: AES CTR mode with 128 bit key length
create_slot	no	Bool	No	Create a replication slot for all server. Valid values are: yes,
ssh_hostname		String	Yes	Defines the hostname of the remote system for connection

Property	Default	Unit	Required	Description
ssh_username		String	Yes	Defines the username of the remote system for connection
ssh_base_dir		String	Yes	The base directory for the remote backup
ssh_ciphers	aes-256- ctr, aes-192- ctr, aes-128- ctr	String	No	The supported ciphers for communication. aes or aes-256 or aes-256-cbc: AES CBC (Cipher Block Chaining) mode with 256 bit key length aes-192 or aes-192-cbc: AES CBC mode with 192 bit key length aes-128 or aes-128-cbc: AES CBC mode with 128 bit key length aes-256-ctr: AES CTR (Counter) mode with 256 bit key length aes-192-ctr: AES CTR mode with 192 bit key length aes-128-ctr: AES CTR mode with 192 bit key length aes-128-ctr: AES CTR mode with 192 bit key length aes-128-ctr: AES CTR mode with 128 bit key length. Otherwise verbatim
s3_aws_region		String	Yes	The AWS region

Property	Default	Unit	Required	Description
s3_access_key_id		String	Yes	The IAM access key ID
s3_secret_access_key		String	Yes	The IAM secret access key
s3_bucket		String	Yes	The AWS S3 bucket name
s3_base_dir		String	Yes	The base directory for the S3 bucket
azure_storage_account		String	Yes	The Azure storage account name
azure_container		String	Yes	The Azure container name
azure_shared_key		String	Yes	The Azure storage account key
azure_base_dir		String	Yes	The base directory for the Azure container
retention	7, - , - , -	Array	No	The retention time in days, weeks, months, years
retention_interval	300	Int	No	The retention check interval
log_type	console	String	No	The logging type (console, file, syslog)

Property	Default	Unit	Required	Description
log_level	info	String	No	The logging level, any of the (case insensitive) strings FATAL, ERROR, WARN, INFO and DEBUG (that can be more specific as DEBUG1 thru DEBUG5). Debug level greater than 5 will be set to DEBUG5. Not recognized values will make the log_level be INFO
log_path	pgmoneta.	String	No	The log file location Can be a strftime(3) compatible string.
log_rotation_age	0	String	No	The time after which log file rotation is triggered. If this value is specified without units, it is taken as seconds. Setting this parameter to 0 disables log rotation based on time. It supports the following units as suffixes: 'S' for seconds (default), 'I for minutes, 'H' for hours, 'D' for days, and 'W' for weeks.

Property	Default	Unit	Required	Description
log_rotation_size	0	String	No	The size of the log file that will trigger a log rotation. Supports suffixes: 'B (bytes), the default if omitted, 'K' or 'KB' (kilobytes), 'M' or 'MB' (megabytes), 'G' or 'GB' (gigabytes). A value of 0 (with or without suffix) disables.
log_line_prefix	%Y-%m- %d %H:%M:%	String S	No	A strftime(3) compatible string to use as prefix for every log line. Must be quoted if contains spaces.
log_mode	append	String	No	Append to or create the log file (append, create)

Property	Default	Unit	Required	Description
blocking_timeout	30	String	No	The number of seconds the process will be blocking for a connection. If this value is specified without units, it is taken as seconds. Setting this parameter to 0 disables it. It supports the following units as suffixes: 'S' for seconds (default), 'M for minutes, 'H' for hours, 'D' for days, and 'W' for weeks.
tls	off	Bool	No	Enable Transport Layer Security (TLS)
tls_cert_file		String	No	Certificate file for TLS. This file must be owned by either the user running pgmoneta or root.
tls_key_file		String	No	Private key file for TLS. This file must be owned by either the user running pgmoneta or root. Additionally permissions must be at least 0640 when owned by root or 0600 otherwise.

Property	Default	Unit	Required	Description
tls_ca_file		String	No	Certificate Authority (CA) file for TLS. This file must be owned by either the user running pgmoneta oroot.
metrics_cert_file		String	No	Certificate file for TLS for Prometheus metrics. This file must be owned by either the user running pgmoneta or root.
metrics_key_file		String	No	Private key file for TLS for Prometheus metrics. This file must be owned by either the user running pgmoneta or root. Additionally permissions must be at least 0640 when owned by root or 0600 otherwise.
metrics_ca_file		String	No	Certificate Authority (CA) file for TLS for Prometheus metrics. This file must be owned by either the user running pgmoneta or root.

Property	Default	Unit	Required	Description
libev	auto	String	No	Select the libev backend to use. Valid options: auto, select, poll, epoll, iouring, devpoll and port
backup_max_rate	0	Int	No	The number of bytes of tokens added every one second to limit the backup rate
network_max_rate	0	Int	No	The number of bytes of tokens added every one second to limit the netowrk backup rate
manifest	sha256	String	No	The hash algoritm for the manifest. Valid options: crc32c, sha224, sha256, sha384 and sha512
keep_alive	on	Bool	No	Have SO_KEEPALIVE on sockets
nodelay	on	Bool	No	Have TCP_NODELAY on sockets
non_blocking	on	Bool	No	Have O_NONBLOCK on sockets
backlog	16	Int	No	The backlog for listen(). Minimum 16

Property	Default	Unit	Required	Description
hugepage	try	String	No	Huge page support (off, try , on)
pidfile		String	No	Path to the PID file. If not specified, it will be automatically set to unix_socket_dir/pgmoneta. <pre>host>.pid where <host> is the value of the host parameter or all if host = *.</host></pre>

Property	Default	Unit	Required	Description
update_process_title	verbose	String	No	The behavior for updating the operating system process title. Allowed settings are never (or off), does not update the process title; strict to set the process title without overriding the existing initial process title length; minimal to set the process title to the base description; verbose (or full to set the process title to the full description. Please note that strict and minimal are honored only on those systems that do not provide a native way to set the process title (e.g., Linux). On other systems, there is not difference between strict and minimal and the assumed behaviour is minimal even if strict is used. never and verbose are alway honored, on every
				system. On Linux 3
				title is always
				trimmed to 255
				นากกายน เบ 255

4.2 Server section

Property	Default	Unit	Required	Description
host		String	Yes	The address of the PostgreSQL instance
port		Int	Yes	The port of the PostgreSQL instance
user		String	Yes	The replication user name
wal_slot		String	Yes	The replication slot fo WAL
create_slot	no	Bool	No	Create a replication slot for this server. Valid values are: yes, no
follow		String	No	Failover to this server if follow server fails
retention		Array	No	The retention for the server in days, weeks, months, years
wal_shipping		String	No	The WAL shipping directory
workspace	/tmp/pgmoneta workspace/	- String	No	The directory for the workspace that incremental backup can use for its work
hot_standby		String	No	Hot standby directory
hot_standby_overrides		String	No	Files to override in the hot standby directory
hot_standby_tablespaces		String	No	Tablespace mappings for the hot standby. Syntax is [from -> to,?]+

Property	Default	Unit	Required	Description
workers	-1	Int	No	The number of workers that each process can use for its work. Use 0 to disable -1 means use the global settting. Maximum is CPU count
backup_max_rate	-1	Int	No	The number of bytes of tokens added every one second to limit the backup rate. Use 0 to disable, -1 means use the global settting
network_max_rate	-1	Int	No	The number of bytes of tokens added every one second to limit the netowrk backup rate. Use 0 to disable, -1 means use the global settting
manifest	sha256	String	No	The hash algoritm for the manifest. Valid options: crc32c, sha224, sha256, sha384 and sha512
tls_cert_file		String	No	Certificate file for TLS. This file must be owned by either the user running pgmoneta or root.

Property	Default	Unit	Required	Description
tls_key_file		String	No	Private key file for TLS. This file must be owned by either the user running pgmoneta or root. Additionally permissions must be at least 0640 when owned by root or 0600 otherwise.
tls_ca_file		String	No	Certificate Authority (CA) file for TLS. This file must be owned by either the user running pgmoneta or root.
extra		String	No	The source directory for retrieval on the server side (details are in the extra section)

The user specified must have the REPLICATION option in order to stream the Write-Ahead Log (WAL), and must have access to the postgres database in order to get the necessary configuration parameters.

Note, that PostgreSQL 13+ is required, as well as having wal_level at replica or logical level.

Note, that if host starts with a / it represents a path and **pgmoneta** will connect using a Unix Domain Socket.

4.2.1 extra parameter

The extra configuration is set in the server section. It is not required, but if you configure this parameter, when you perform a backup using the CLI pgmoneta-cli -c pgmoneta.conf backup primary, it will also copy all specified files on the server side and send them back to the client side.

This extra feature requires the server side to install the pgmoneta_ext extension and also make the role repl a SUPERUSER (this will be improved in the future). Currently, this feature is only available to the SUPERUSER role.

You can set up pgmoneta_ext by following the README to easily install the extension. There are also more detailed instructions available in the DEVELOPERS documentation.

The format for the extra parameter is a path to a file or directory. You can list more than one file or directory separated by commas. The format is as follows:

```
extra = /tmp/myfile1, /tmp/myfile2, /tmp/mydir1, /tmp/mydir2
```

4.3 pgmoneta_users configuration

The pgmoneta_users configuration defines the users known to the system. This file is created and managed through the pgmoneta-admin tool.

The configuration is loaded from either the path specified by the -u flag or /etc/pgmoneta/pgmoneta_users.conf.

4.4 pgmoneta_admins configuration

The pgmoneta_admins configuration defines the administrators known to the system. This file is created and managed through the pgmoneta-admin tool.

The configuration is loaded from either the path specified by the -A flag or /etc/pgmoneta/pgmoneta_admins.conf.

If pgmoneta has both Transport Layer Security (TLS) and management enabled then pgmoneta-cli can connect with TLS using the files ~/.pgmoneta/pgmoneta.key (must be 0600 permission), ~/.pgmoneta/pgmoneta.crt and ~/.pgmoneta/root.crt.

5 pgmoneta_walinfo configuration

The pgmoneta_walinfo configuration defines the info needed for walinfo to work.

The configuration is loaded from either the path specified by the -c flag or /etc/pgmoneta/pgmoneta_walinfo.conf if -c wasn't provided.

5.1 [pgmoneta_walinfo]

Property	Default	Unit	Required	Description
log_type	console	String	No	The logging type (console, file, syslog)
log_level	info	String	No	The logging level, any of the (case insensitive) strings FATAL, ERROR, WARN, INFO and DEBUG (that can be more specific as DEBUG1 thru DEBUG5). Debug level greater than 5 will be set to DEBUG5. Not recognized values will make the log_level be INFO
log_path	pgmoneta.log	String	No	The log file location. Can be a strftime(3) compatible string.

5.2 Server section

Property	Default	Unit	Required	Description
host		String	Yes	The address of the PostgreSQL instance
port		Int	Yes	The port of the PostgreSQL instance
user		String	Yes	The replication user name

6 Tutorials

6.1 Install pgmoneta

This tutorial will show you how to do a simple installation of **pgmoneta**.

At the end of this tutorial you will have a backup of a PostgreSQL cluster, and will be streaming Write-Ahead Log (WAL) to **pgmoneta**.

Please note that inside the brackets at the end of each step it's the user account you should be using, switch the account when needed.

6.1.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and **pgmoneta**.

For RPM based distributions such as Fedora and RHEL you can add the PostgreSQL YUM repository and do the install via

```
dnf -qy module disable postgresql
dnf install -y postgresql13 postgresql13-server pgmoneta
```

6.1.2 Initialize cluster

```
export PATH=/usr/pgsql-13/bin:$PATH initdb -k /tmp/pgsql
```

(postgres user)

6.1.3 Remove default access

Remove

host	all	all	127.0.0.1/32	trust
host	all	all	::1/128	trust
host	replication	all	127.0.0.1/32	trust
host	replication	all	::1/128	trust

```
from /tmp/pgsql/pg_hba.conf
```

(postgres user)

6.1.4 Add access for users and a database

Add

hos	st mydb	myuser	127.0.0.1/32	md5
hos	st mydb	myuser	::1/128	md5
hos	st postgres	repl	127.0.0.1/32	md5
hos	st postgres	repl	::1/128	md5
hos	st replication	n repl	127.0.0.1/32	md5
hos	st replicatio	n repl	::1/128	md5

to/tmp/pgsql/pg_hba.conf

Remember to check the value of password_encryption in /tmp/pgsql/postgresql.conf to setup the correct authentication type.

(postgres user)

6.1.5 Make sure that replication level is set

Check that

```
wal_level = replica
```

 $is\,set\,in\,/\,tmp/pgsql/postgresql.conf-or\,logical\\$

(postgres user)

6.1.6 Start PostgreSQL

```
pg_ctl -D /tmp/pgsql/ start
```

(postgres user)

6.1.7 Add users and a database

```
createuser -P myuser
createdb -E UTF8 -O myuser mydb
```

with mypass as the password.

Then

```
psql postgres
CREATE ROLE repl WITH LOGIN REPLICATION PASSWORD 'secretpassword';
\q
```

(postgres user)

6.1.8 Add Write-Ahead Log (WAL) replication slot

```
psql postgres
SELECT pg_create_physical_replication_slot('repl', true, false);
\q
```

(postgres user)

6.1.9 Verify access

For the user myuser using mypass as the password

```
psql -h localhost -p 5432 -U myuser mydb
\q
```

For the user repl using secret password as the password

```
psql -h localhost -p 5432 -U repl postgres
```

(postgres user)

6.1.10 Add pgmoneta user

```
sudo su -
useradd -ms /bin/bash pgmoneta
passwd pgmoneta
exit
```

(postgres user)

6.1.11 Create pgmoneta configuration

Switch to the pgmoneta user

```
sudo su -
su - pgmoneta
```

Add the master key and create vault

```
pgmoneta-admin master-key
pgmoneta-admin -f pgmoneta_users.conf -U repl user add
```

You have to choose a password for the master key - remember it!

For scripted use, the master key and user password can be provided using the PGMONETA_PASSWORD environment variable.

If you see an error saying error while loading shared libraries: libpgmoneta.so. 0: cannot open shared object running the above command. you may need to locate where your libpgmoneta.so. 0 is. It could be in /usr/local/lib or /usr/local/lib64 depending on your environment. Add the corresponding directory into /etc/ld.so.conf, or alternatively, create a file called pgmoneta_shared_library.conf under/etc/ld.so.conf.d/, and add your directory into it. Remember to run ldconfig to make the change effective

Create the pgmoneta.conf configuration

```
cat > pgmoneta.conf
[pgmoneta]
host = *
metrics = 5001
create_slot = yes
base_dir = /home/pgmoneta/backup
compression = zstd
storage_engine = local
retention = 7
log_type = file
log_level = info
log_path = /tmp/pgmoneta.log
unix_socket_dir = /tmp/
[primary]
host = localhost
port = 5432
user = repl
wal_slot = repl
```

and press Ctrl-d

6.1.12 Create base directory

```
mkdir backup
```

(pgmoneta user)

6.1.13 Start pgmoneta

```
pgmoneta -c pgmoneta.conf -u pgmoneta_users.conf
```

(pgmoneta user)

6.1.14 Create a backup

In another terminal

```
pgmoneta-cli -c pgmoneta.conf backup primary
```

(pgmoneta user)

6.1.15 View backup

In another terminal

```
pgmoneta-cli -c pgmoneta.conf status details
```

(pgmoneta user)

6.1.16 Shell completion

There is a minimal shell completion support for pgmoneta-cli and pgmoneta-admin. If you are running such commands from a Bash or Zsh, you can take some advantage of command completion.

6.1.16.1 Installing command completions in Bash There is a completion script into contrib/ shell_comp/pgmoneta_comp.bash that can be used to help you complete the command line while you are typing.

It is required to source the script into your current shell, for instance by doing:

```
source contrib/shell_comp/pgmoneta_comp.bash
```

At this point, the completions should be active, so you can type the name of one the commands between pgmoneta-cli and pgmoneta-admin and hit <TAB> to help the command line completion.

6.1.16.2 Installing the command completions on Zsh In order to enable completion into zsh you first need to have compinit loaded; ensure your .zshrc file contains the following lines:

```
autoload -U compinit compinit
```

and add the sourcing of the contrib/shell_comp/pgmoneta_comp.zsh file into your ~/. zshrc also associating the _pgmoneta_cli and _pgmoneta_admin functions to completion by means of compdef:

```
source contrib/shell_comp/pgmoneta_comp.zsh
compdef _pgmoneta_cli pgmoneta-cli
compdef _pgmoneta_admin pgmoneta-admin
```

If you want completions only for one command, e.g., pgmoneta-admin, remove the compdef line that references the command you don't want to have automatic completion. At this point, digit the name of a pgmoneta-cli or pgmoneta-admin command and hit <TAB> to trigger the completion system.

6.2 Remote administration for pgmoneta

This tutorial will show you how to do setup remote management for **pgmoneta**.

6.2.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and **pgmoneta**.

See Install pgmoneta for more detail.

6.2.2 Change the pgmoneta configuration

Change pgmoneta.conf to add

```
management = 5002
```

under the [pgmoneta] setting, like

```
[pgmoneta]
...
management = 5002
```

(pgmoneta user)

6.2.3 Add pgmoneta admin

```
pgmoneta-admin -f pgmoneta_admins.conf -U admin -P admin1234 user add

(pgmoneta user)
```

6.2.4 Restart pgmoneta

Shutdown pgmoneta and start it again with

```
pgmoneta-cli -c pgmoneta.conf shutdown
pgmoneta -c pgmoneta.conf -u pgmoneta_users.conf -A pgmoneta_admins.conf
```

(pgmoneta user)

6.2.5 Connect via remote administration interface

```
pgmoneta-cli -h localhost -p 5002 -U admin status details
and use admin1234 as the password
```

(pgmoneta user)

6.2.6 Using Transport Level Security for access

You can security the administration level interface by using Transport Level Security (TLS).

It is done by setting the following options,

```
[pgmoneta]
tls_cert_file=/path/to/server.crt
tls_key_file=/path/to/server.key
tls_ca_file=/path/to/root.crt
...
```

in pgmoneta.conf.

The client side setup must go into ~/.pgmoneta/ with the following files

```
~/.pgmoneta/pgmoneta.key
~/.pgmoneta/pgmoneta.crt
~/.pgmoneta/root.crt
```

They must have 0600 permission.

6.3 Prometheus metrics for pgmoneta

This tutorial will show you how to do setup Prometheus metrics for **pgmoneta**.

6.3.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and **pgmoneta**.

See Install pgmoneta for more detail.

6.3.2 Change the pgmoneta configuration

Change pgmoneta.conf to add

```
metrics = 5001
```

under the [pgmoneta] setting, like

```
[pgmoneta]
...
metrics = 5001
```

(pgmoneta user)

6.3.3 Restart pgmoneta

Shutdown pgmoneta and start it again with

```
pgmoneta-cli -c pgmoneta.conf shutdown
pgmoneta -c pgmoneta.conf -u pgmoneta_users.conf
```

6.3.4 Get Prometheus metrics

You can now access the metrics via

```
http://localhost:5001/metrics
```

(pgmoneta user)

6.3.5 TLS support

To add TLS support for Prometheus metrics, first we need a self-signed certificate. 1. Generate CA key and certificate

```
openssl genrsa -out ca.key 2048
openssl req -x509 -new -nodes -key ca.key -sha256 -days 3650 -out ca.crt -
subj "/CN=My Local CA"
```

2. Generate server key and CSR

```
openssl genrsa -out server.key 2048
openssl req -new -key server.key -out server.csr -subj "/CN=localhost"
```

3. Create a config file for Subject Alternative Name

```
cat > server.ext << EOF
authorityKeyIdentifier=keyid,issuer
basicConstraints=CA:FALSE
keyUsage = digitalSignature, nonRepudiation, keyEncipherment,
    dataEncipherment
subjectAltName = @alt_names

[alt_names]
DNS.1 = localhost
IP.1 = 127.0.0.1
EOF</pre>
```

4. Sign the server certificate with our CA

```
openssl x509 -req -in server.csr -CA ca.crt -CAkey ca.key -CAcreateserial -out server.crt -days 3650 -sha256 -extfile server.ext
```

5. Generate client key and certificate

```
openssl genrsa -out client.key 2048
openssl req -new -key client.key -out client.csr -subj "/CN=Client
Certificate"
```

```
openssl x509 -req -in client.csr -CA ca.crt -CAkey ca.key -CAcreateserial -out client.crt -days 3650 -sha256
```

6. Create PKCS#12 file (Optional, needed for browser import)

```
openssl pkcs12 -export -out client.p12 -inkey client.key -in client.crt - certfile ca.crt -passout pass:<your_password>
```

Edit pgmoneta.conf to add the following keys under pgmoneta section:

```
[pgmoneta]
.
.
.
metrics_cert_file=<path_to_server_cert_file>
metrics_key_file=<path_to_server_key_file>
metrics_ca_file=<path_to_ca_file>
```

You can now access the metrics at https://localhost:5001 using curl as follows:

```
curl -v -L "https://localhost:5001" --cacert <path_to_ca_file> --cert <
   path_to_client_cert_file> --key <path_to_client_key_file>
```

(Optional) If you want to access the page through the browser: - First install the certificates on your system - For Fedora: "' # Create directory if it doesn't exist sudo mkdir -p /etc/pki/catrust/source/anchors/

```
# Copy CA cert to the trust store
sudo cp ca.crt /etc/pki/ca-trust/source/anchors/

# Update the CA trust store
sudo update-ca-trust extract
'''

- For Ubuntu:
'''

# Copy the CA certificate to the system certificate store
sudo cp ca.crt /usr/local/share/ca-certificates/

# Update the CA certificate store
sudo update-ca-certificates
'''

- For MacOS:
    - Open Keychain Access and import the certificate file
    - Set the certificate to "Always Trust"
```

- · For browsers like Firefox
 - Go to Menu → Preferences → Privacy & Security

- Scroll down to "Certificates" section and click "View Certificates"
- Go to "Authorities" tab and click "Import"
- Select your ca.crt file
- Check "Trust this CA to identify websites" and click OK
- Go to "Your Certificates" tab
- Click "Import" and select the client.p12 file
- Enter the password you set when creating the PKCS#12 file
- For browsers like Chrome/Chromium
 - For client certificates, go to Settings → Privacy and security → Security → Manage certificates
 - Click on "Import" and select your client.p12 file
 - Enter the password you set when creating it

You can now access metrics at https://localhost:5001

6.4 Backup and restore

This tutorial will show you how to do a backup and a restore using **pgmoneta**.

6.4.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and **pgmoneta**.

See Install pgmoneta for more detail.

6.4.2 Backup

```
pgmoneta-cli -c pgmoneta.conf backup primary
```

will take a backup of the [primary] host.

(pgmoneta user)

6.4.3 List backups

```
pgmoneta-cli -c pgmoneta.conf list-backup primary
```

6.4.4 Restore

```
pgmoneta-cli -c pgmoneta.conf restore primary newest current /tmp/
```

will take the latest backup and all Write-Ahead Log (WAL) segments and restore it into the /tmp/primary-<timestamp> directory for an up-to-date copy.

The 2nd to last parameter allows

- current means copy the Write-Ahead Log (WAL), and restore to first stable checkpoint
- name=X means copy the Write-Ahead Log (WAL), and restore to the label specified
- xid=X means copy the Write-Ahead Log (WAL), and restore to the XID specified
- time=X means copy the Write-Ahead Log (WAL), and restore to the timestamp specified
- lsn=X means copy the Write-Ahead Log (WAL), and restore to the Log Sequence Number (LSN) specified
- inclusive=X means that the restore is inclusive of the specified information
- timeline=X means that the restore is done to the specified information timeline
- action=X means which action should be executed after the restore (pause, shutdown)
- primary means that the cluster is setup as a primary
- replica means that the cluster is setup as a replica

More information

(pgmoneta user)

6.5 Verify

This tutorial will show you how to verify a backup using **pgmoneta**.

6.5.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and pgmoneta.

See Install pgmoneta for more detail.

6.5.2 Verify

```
pgmoneta-cli -c pgmoneta.conf verify primary oldest /tmp
```

will verify the oldest backup of the [primary] host.

6.6 Archive

This tutorial will show you how to do an archive using **pgmoneta**.

6.6.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and **pgmoneta**.

See Install pgmoneta for more detail.

6.6.2 Creating an archive

```
pgmoneta-cli -c pgmoneta.conf archive primary newest current /tmp/
```

will take the latest backup and all Write-Ahead Log (WAL) segments and create an archive named /tmp/primary-<timestamp>.tar.zstd. This archive will contain an up-to-date copy. (pgmoneta user)

6.7 Delete a backup

This tutorial will show you how to delete a backup from **pgmoneta**.

6.7.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and **pgmoneta**.

See Install pgmoneta for more detail.

6.7.2 Delete the oldest backup

```
pgmoneta-cli -c pgmoneta.conf delete primary oldest
```

will delete the oldest backup on [primary].

Note that if the backup has an incremental backup child that depends on it, its data will be rolled up to its child before getting deleted.

6.8 Encryption and Decryption

This tutorial will show you how to use encryption and decryption features in **pgmoneta**.

6.8.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and **pgmoneta**.

See Install pgmoneta for more detail.

6.8.2 Enable Encryption and Decryption in pgmoneta workflow

By default, the encryption is disabled. To enable this feature, modify pgmoneta.conf:

```
encryption = aes-256-cbc
```

(pgmoneta user)

Many encryption modes are supported, see Configuration for details.

6.8.3 Encryption and Decryption Commands

pgmoneta use the same key created by pgmoneta-admin master-key to encrypt and decrypt files.

Encrypt a file with pgmoneta-cli encrypt, the file will be encrypted in place and remove unencrypted file on success.

```
pgmoneta-cli -c pgmoneta.conf encrypt '<path-to-your-file>/file.tar.zstd'
```

Decrypt a file with pgmoneta-cli decrypt, the file will be decrypted in place and remove encrypted file on success.

```
pgmoneta-cli -c pgmoneta.conf decrypt '<path-to-your-file>/file.tar.zstd.
aes'
```

pgmoneta-cli encrypt and pgmoneta-cli decrypt are built to deal with files created by pgmoneta-cli archive. It can be used on other files though.

6.9 Retention Policy

This tutorial will show you how to configure retention to retain backups.

6.9.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and **pgmoneta**.

See Install pgmoneta for more detail.

6.9.2 Retention Setup

In pgmoneta.conf, you can use retention = 7, 4, 12, 5 to configure **pgmoneta** to retain backups within the nearest 7 days, 4 weeks, 12 months and 5 years. Specifically, **pgmoneta** will retain all the backups within the nearest 7 days, the latest backup on each Monday within the nearest 4 weeks, the latest backup on the first day of each month in the last 12 months and the latest backup on the first day of each year in the last 5 years. If you input more than 4 values, **pgmoneta** will only read the first 4.

Note that if a backup has an incremental backup child that depends on it, its data will be rolled up to its child before getting deleted.

There are a lot of ways to leave a parameter unspecified. For trailing parameters, you can simply omit them. And for parameters in between, you can use placeholders. Currently, placeholders we allow are: -, X, x, 0 or whitespaces (spaces or tabs).

Please note that you should always configure days to retain the nearest backups. If you don't configure retention, by default **pgmoneta** keeps backups within the nearest 7 days and other parameters (weeks, months, years) are unspecified. Additionally, if you are using prometheus, unspecified values will be shown as 0.

6.9.3 Retention Validation Rule

Current validation rule is:

- 1. Retention days >= 1
- 2. If retention months is specified, then 1 <= weeks <= 4, otherwise weeks >= 1
- 3. If retention years is specified, then 1 <= months <= 12, otherwise months >= 1
- 4. Retention years >= 1 Please note that the rule above only checks specified parameters, except for days, which should always be specified

6.10 Retention check

The retention check runs every 5 minutes, and will delete one backup per run.

You can change this to every 30 minutes by

```
retention_interval = 1800
```

under the [pgmoneta] configuration.

6.11 Grafana Dashboard

This tutorial will show you how to encapsulate Prometheus standard API and use them to monitor state of **pgmoneta** with the help of Grafana dashboard.

6.11.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and **pgmoneta**.

See Install pgmoneta for more detail.

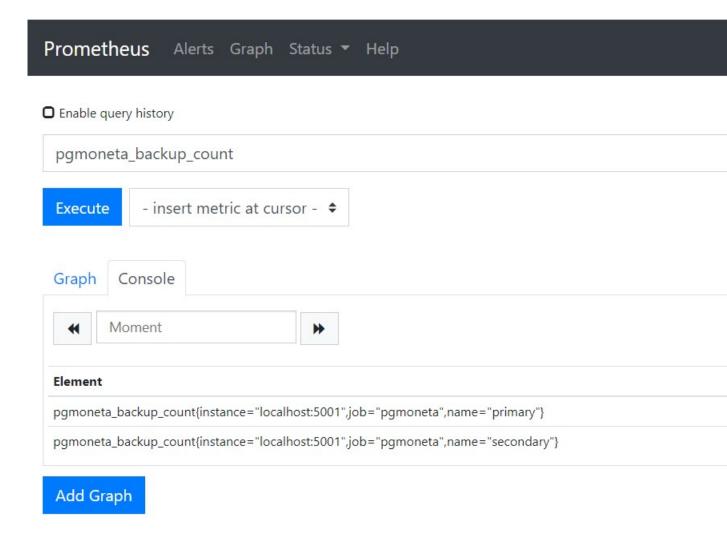

6.11.2 Prometheus Configuration

First of all, you should install Prometheus in your **pgmoneta** server.

After you successfully installed Prometheus, you should replace prometheus.yml with the content below to configure how to query your **pgmoneta** metrics.

```
scrape_configs:
  - job_name: 'pgmoneta'
  metrics_path: '/metrics'
  static_configs:
    - targets: ['localhost:5001']
```

Then the Prometheus service will query your **pgmoneta** metrics every 15 seconds and package them as time-series data. You can query your **pgmoneta** metrics and watch their changes as time passed in Prometheus web page (default port is 9090).

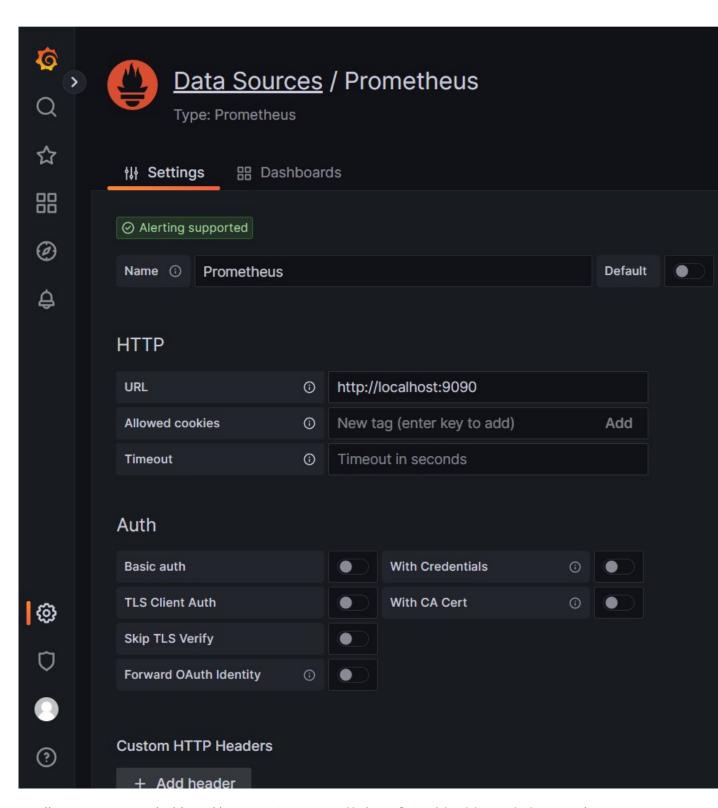

Prometheus Alerts Graph Status ▼ Help ■ Enable query history pgmoneta_backup_count Execute - insert metric at cursor - \$ Graph Console 1h Until * Res. (s) 3 2 0 16:15 16:30

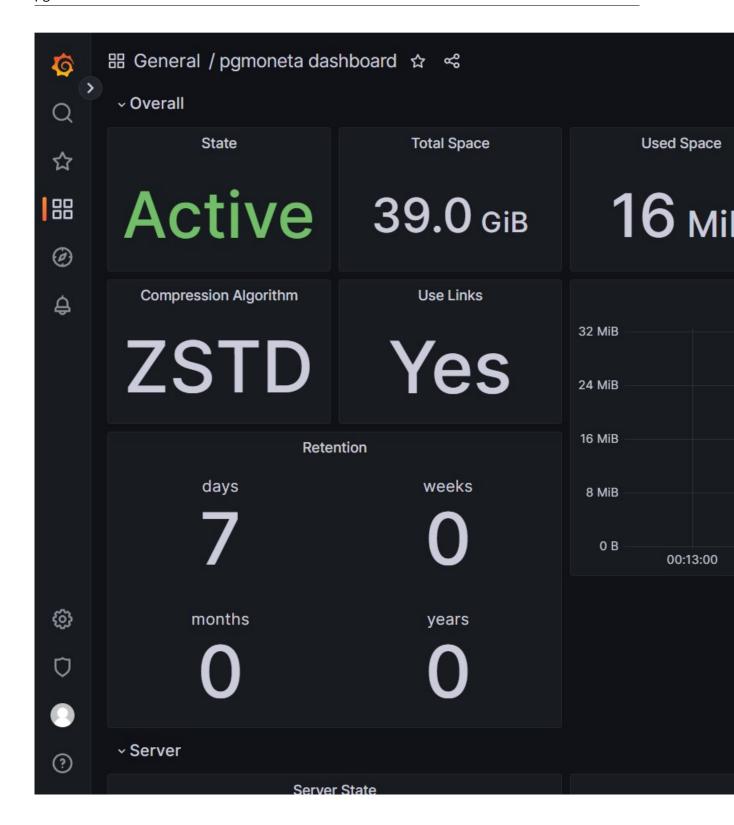

6.11.3 Grafana Dashboard Import

Although Prometheus provides capacity of querying and monitoring metrics, we can not customize graphs for each metric and provide a unified view.

As a result, we use Grafana to help us manage all graphs together. First of all, we should install Grafana in the computer you need to monitor **pgmoneta** metrics. You can browse Grafana web page with default port 3000, default user admin and default password admin. Then you can create Prometheus data source of **pgmoneta**.

Finally you can create dashboard by importing contrib/grafana/dashboard.json and monitor metrics about **pgmoneta**.

6.12 WAL shipping

This tutorial will show you how to configure WAL shipping, so that if the backup server crashes, you will be able to use an older archive to do Point-in-Time recovery with WAL segments shipped to another server/local directory.

Note that this feature is still at its early stages, that it currently only ships WAL segments to another LOCAL directory. You do not need to make sure the directory is unique for each server, the WAL copy will be saved under the subdirectory server_name/wal/

6.12.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and **pgmoneta**.

See Install pgmoneta for more detail.

6.12.2 Configuration

In order to use WAL shipping, simply add

```
wal_shipping = your/local/wal/shipping/directory
```

to the corresponding server section of pgmoneta.conf, **pgmoneta** will create the directory if it doesn't exist, and ship a copy of WAL segments under the subdirectory your/local/wal/shipping/directory/server_name/wal.

6.12.3 Prometheus

You can monitor the disk usage regarding WAL shipping using prometheus. Here are some metrics.

```
pgmoneta_wal_shipping(name) -- size of the WAL shipping for the server (
   wal/shipping/directory/server_name/wal)
pgmoneta_wal_shipping_used_space -- size of everything under the WAL
   shipping directory; this could include archives (wal/shipping/directory
   /server_name/)
pgmoneta_wal_shipping_free_space -- free size of the WAL shipping
   directory for the server (wal/shipping/directory/server_name/)
pgmoneta_wal_shipping_total_space -- total size of the WAL shipping
   directory for the server (wal/shipping/directory/server_name/)
```

6.13 Use of Transport Level Security (TLS)

This tutorial is about using Transport Level Security (TLS) in PostgreSQL, and how it affects **pgmoneta**.

Note, that this tutorial is an example on how to setup a PostgreSQL TLS environment for development use only!

6.13.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+, OpenSSL and **pgmoneta**. See Install pgmoneta for more detail.

6.13.2 PostgreSQL

Generate the server key

```
openssl genrsa -aes256 8192 > server.key
```

Remove the passphase

```
openssl rsa -in server.key -out server.key
```

Set the server key permission

```
chmod 400 server.key
```

Generate the server certificate

```
openssl req -new -key server.key -days 3650 -out server.crt -x509
```

Use the server certificate as the root certificate (self-signed)

```
cp server.crt root.crt
```

In postgresql.conf change the following settings

```
listen_addresses = '*'
ssl = on
ssl_ca_file = '/path/to/root.crt'
ssl_cert_file = '/path/to/server.crt'
ssl_key_file = '/path/to/server.key'
ssl_prefer_server_ciphers = on
```

In pg_hba.conf change

host	all	all	0.0.0.0/0	scram-sha-256
to				
hostssl	all	all	0.0.0.0/0	scram-sha-256

In this scenario there are no changes to the pgmoneta.conf configuration file.

6.13.3 Using client certificate

Create the client key

```
openssl ecparam -name prime256v1 -genkey -noout -out client.key
```

Create the client request - remember that the CN has to have the name of the replication user

```
openssl req -new -sha256 -key client.key -out client.csr -subj "/CN=repl"
```

Generate the client certificate

```
openssl x509 -req -in client.csr -CA root.crt -CAkey server.key -
CAcreateserial -out client.crt -days 3650 -sha256
```

You can test your setup by copying the files into the default PostgreSQL client directory, like

```
mkdir ~/.postgresql
cp client.crt ~/.postgresql/postgresql.crt
cp client.key ~/.postgresql/postgresql.key
cp root.crt ~/.postgresql/ca.crt
chmod 0600 ~/.postgresql/postgresql.crt ~/.postgresql/postgresql.key ~/.
    postgresql/ca.crt
```

and then test with the psql command.

In pg_hba.conf change

```
hostssl all 0.0.0.0/0 scram-sha-256
```

to

```
hostssl all 0.0.0.0/0 scram-sha-256 clientcert=verify-ca
```

In pgmoneta.conf add the paths to the server in question, like

```
[pgmoneta] ...
```

```
[primary]
host=...
port=...
user=repl
tls_cert_file=/path/to/home/.postgresql/postgresql.crt
tls_key_file=/path/to/home/.postgresql/postgresql.key
tls_ca_file=/path/to/home/.postgresql/ca.crt
```

6.13.4 More information

- Secure TCP/IP Connections with SSL
- The pg_hba.conf File

6.14 Hot standby

This tutorial will show you how to configure a hot standby instance.

6.14.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+ and pgmoneta.

See Install pgmoneta for more detail.

6.14.2 Configuration

In order to use hot standby, simply add

```
hot_standby = /your/local/hot/standby/directory
```

to the corresponding server section of pgmoneta.conf. **pgmoneta** will create the directory if it doesn't exist, and keep the latest backup in the defined directory.

You can use

```
hot_standby_overrides = /your/local/hot/standby/overrides/
```

to override files in the hot_standby directory.

6.14.3 Tablespaces

By default tablespaces will be mapped to a similar path than the original one, for example /tmp/mytblspc becomes /tmp/mytblspchs.

However, you can use the directory name to map it to another directory, like

```
hot_standby_tablespaces = /tmp/mytblspc->/tmp/mybcktblspc
```

You can also use the OID for the key part, like

```
hot_standby_tablespaces = 16392->/tmp/mybcktblspc
```

Multiple tablespaces can be specified using a, between them.

6.15 Annotate a backup with comments

This tutorial is about adding commnents to a backup.

6.15.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+, OpenSSL and **pgmoneta**. See Install pgmoneta for more detail.

6.15.2 Add a comment

You can add a comment by

```
pgmoneta-cli -c pgmoneta.conf annotate primary newest add mykey mycomment
```

6.15.3 Update a comment

You can update a comment by

```
pgmoneta-cli -c pgmoneta.conf annotate primary newest update mykey mynewcomment
```

6.15.4 Remove a comment

You can remove a comment by

```
pgmoneta-cli -c pgmoneta.conf annotate primary newest remove mykey
```

6.15.5 View comments

You can view the comments by

```
pgmoneta-cli -c pgmoneta.conf info primary newest
```

6.16 Feature extra

This tutorial will show you how to configure the extra feature to retrieve extra files and directories (recursively) from the PostgreSQL server instance.

6.16.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 13+, **pgmoneta_ext**, and **pgmoneta**.

See Install pgmoneta_ext and Install pgmoneta for more detail.

6.16.2 Configuration

In order to use exta, simply add

```
extra = /tmp/myfile, /tmp/mydir, /tmp/mydirs
```

to the corresponding server section of pgmoneta.conf. **pgmoneta** will retrieve extra files and directories (recursively) from the PostgreSQL server instance when performing a backup.

You can use

```
pgmoneta-cli -c pgmoneta.conf backup primary
```

to trigger the client to get extra files from the server side.

All the files will be stored in the /extra directory under the backup directory. For our configuration, they will be stored in the /tmp/primary/<timestamp>/extra directory.

6.16.3 Info

You can use

```
pgmoneta-cli -c pgmoneta.conf info primary newest
```

to show all copied extra files, something like this (only showing successfully copied files):

```
Extra : myfile, ...
```

6.17 Incremental backup and restore

This tutorial will show you how to do an incremental backup and a restore using **pgmoneta**.

6.17.1 Preface

This tutorial assumes that you have an installation of PostgreSQL 17+ and **pgmoneta**.

See Install pgmoneta for more detail.

6.17.2 Full backup

```
pgmoneta-cli -c pgmoneta.conf backup primary
```

will take a full backup of the [primary] host.

(pgmoneta user)

6.17.3 List backups

```
pgmoneta-cli -c pgmoneta.conf list-backup primary
```

(pgmoneta user)

6.17.4 Incremental backup

```
pgmoneta-cli -c pgmoneta.conf backup primary newest
```

will take an incremental backup of the [primary] host.

Note that currently branching is not allowed for incremental backup – a backup can have at most 1 incremental backup child.

(pgmoneta user)

6.17.5 List backups

```
pgmoneta-cli -c pgmoneta.conf list-backup primary
```

(pgmoneta user)

6.17.6 Restore

```
pgmoneta-cli -c pgmoneta.conf restore primary newest current /tmp/
```

will take the latest backup and all Write-Ahead Log (WAL) segments and restore it into the /tmp/primary-<timestamp> directory for an up-to-date copy.

The 2nd to last parameter allows

- current means copy the Write-Ahead Log (WAL), and restore to first stable checkpoint
- name=X means copy the Write-Ahead Log (WAL), and restore to the label specified
- xid=X means copy the Write-Ahead Log (WAL), and restore to the XID specified
- time=X means copy the Write-Ahead Log (WAL), and restore to the timestamp specified
- lsn=X means copy the Write-Ahead Log (WAL), and restore to the Log Sequence Number (LSN) specified
- inclusive=X means that the restore is inclusive of the specified information
- timeline=X means that the restore is done to the specified information timeline
- action=X means which action should be executed after the restore (pause, shutdown)
- primary means that the cluster is setup as a primary
- replica means that the cluster is setup as a replica

More information

(pgmoneta user)

7 Running pgmoneta with Docker

You can run pgmoneta using Docker instead of compiling it manually.

7.1 Prerequisites

- Docker or Podman must be installed on the server where PostgreSQL is running.
- Ensure PostgreSQL is configured to allow external connections.

7.2 Step 1: Enable External PostgreSQL Access

Modify the local PostgreSQL server's postgresql.conf file to allow connections from outside:

```
listen_addresses = '*'
```

Update pg_hba.conf to allow remote connections:

```
host all all 0.0.0.0/0 scram-sha-256
```

Then, restart PostgreSQL for the changes to take effect:

```
sudo systemctl restart postgresql
```

7.3 Step 2: Clone the Repository

```
git clone https://github.com/pgmoneta/pgmoneta.git
cd pgmoneta
```

7.4 Step 3: Build the Docker Image'

There are two Dockerfiles available: 1. Alpine-based image

Using Docker sh docker build -t pgmoneta:latest -f ./contrib/docker/Dockerfile.alpine . **Using Podman** sh podman build -t pgmoneta:latest -f ./contrib/docker/Dockerfile.alpine .

2. Rocky Linux 9-based image Using Docker

```
docker build -t pgmoneta:latest -f ./contrib/docker/Dockerfile.rocky9
```

Using Podman

```
podman build -t pgmoneta:latest -f ./contrib/docker/Dockerfile.rocky9
.
```

7.5 Step 4: Run pgmoneta as a Docker Container

Once the image is built, run the container using: - **Using Docker** sh docker run -d --name pgmoneta --network host pgmoneta:latest-**Using Podman** sh podman run -d --name pgmoneta --network host pgmoneta:latest

7.6 Step 5: Verify the Container

Check if the container is running:

- Using Docker sh docker ps | grep pgmoneta
- Using Podman sh podman ps | grep pgmoneta

Check logs for any errors: - **Using Docker** sh docker logs pgmoneta - **Using Podman** sh podman logs pgmoneta

You can also inspect the exposed server at:

```
http://localhost:5001/
```

8 Test

8.1 Local Environment

To ensure the test suite works well, please make sure you have installed PostgreSQL 17.x version installed

For RPM based distributions such as Fedora and RHEL you can add the PostgreSQL YUM repository and do the install via

```
dnf -qy module disable postgresql
dnf install -y postgresql17 postgresql17-server pgmoneta
```

also make sure that the initdb, pg_ctl and psql are in PATH variable.

8.1.1 Add Path variable

Add the initdb, pg_ctl and psql binaries into the environment path.

```
export PATH=$PATH:$(dirname $(which initdb))
export PATH=$PATH:$(dirname $(which psql))
```

Note: initdb and pg_ctl belongs to same binary directory

8.1.2 Install check library

Before you test, you need to install the check library. If there is no package for check, the CMakeLists.txt will not compile the test suite. Only after you have installed check will it compile the test suite.

```
dnf install -y check check-devel check-static
```

8.1.3 Build the project

Make sure to execute the test script inside the project build. Run the following commands if project is not already built.

```
git clone https://github.com/pgmoneta/pgmoneta.git
cd pgmoneta
mkdir build
cd build
cmake -DCMAKE_C_COMPILER=clang -DCMAKE_BUILD_TYPE=Debug ..
make
```

8.1.4 Run test suites

To run the testsuites get inside your build and just execute -

```
./testsuite.sh
```

The script creates the PostgreSQL and pgmoneta environment inside the build itself for example - - the PostgreSQL related files like the data directory and PostgreSQL configuration will be stored in pgmoneta-postgres - the pgmoneta related files like pgmoneta configuration and users file will be stored in pgmoneta-testsiute

It will be the responsibility of the script to clean up the setup environment.

Note: You can however view the PostgreSQL and pgmoneta server logs in a separate log directory inside build.

In case you see those setup directories like pgmoneta-postgres and pgmoneta-testsiute in build after successfully executing the script, you should probably run

```
./testsuite clean
```

before running the script again to avoid any inconsistency or errors. The clean subcommand will however clean the logs as well.

8.1.5 Add testcases

To add an additional testcase go to testcases directory inside the pgmoneta project.

Create a .c file that contains the test suite and its corresponding .h file (see pgmoneta_test_1.c or pgmoneta_test_2.c for reference). Add the above created suite to the test runner in runner.c

Also remember to link the new test suite in CMakeLists file inside test directory

```
30: set(SOURCES
31: testcases/common.c
32: testcases/pgmoneta_test_1.c
33: testcases/pgmoneta_test_2.c
34: testcases/runner.c
35: )
```

9 Command line interface

The **pgmoneta-cli** command line interface controls your interaction with **pgmoneta**.

It is important that you only use the pgmoneta-cli command line interface to operate on your backup directory

Using other commands on the backup directory could cause problems.

```
pgmoneta-cli 0.16.1
 Command line utility for pgmoneta
 pgmoneta-cli [ -c CONFIG_FILE ] [ COMMAND ]
Options:
  -c, --config CONFIG_FILE
                                                  Set the path to the
    pgmoneta.conf file
 -h, --host HOST
                                                  Set the host name

9.1 backup

Backup a server

The command for a full backup is

```
pgmoneta-cli backup <server>
```

Example

```
pgmoneta-cli backup primary
```

The command for an incremental backup is

```
pgmoneta-cli backup <server> <identifier>
```

where the identifier is the identifier for a backup.

Example

```
pgmoneta-cli backup primary 20250101120000
```

9.2 list-backup

List the backups for a server

Command

```
pgmoneta-cli list-backup <server> [--sort asc|desc]
```

pgmoneta

The --sort option allows sorting backups by timestamp: - asc for ascending order (oldest first) - desc for descending order (newest first)

Example

```
pgmoneta-cli list-backup primary
```

Example with sorting

```
pgmoneta-cli list-backup primary --sort desc
```

9.3 restore

Restore a backup from a server

Command

where

- current means copy the Write-Ahead Log (WAL), and restore to first stable checkpoint
- name=X means copy the Write-Ahead Log (WAL), and restore to the label specified
- xid=X means copy the Write-Ahead Log (WAL), and restore to the XID specified
- time=X means copy the Write-Ahead Log (WAL), and restore to the timestamp specified
- lsn=X means copy the Write-Ahead Log (WAL), and restore to the Log Sequence Number (LSN) specified
- inclusive=X means that the restore is inclusive of the specified information
- timeline=X means that the restore is done to the specified information timeline
- action=X means which action should be executed after the restore (pause, shutdown)

More information

Example

```
pgmoneta-cli restore primary newest name=MyLabel,primary /tmp
```

9.4 verify

Verify a backup from a server

Command

```
pgmoneta-cli verify <server> <directory> [failed|all]
```

Example

```
pgmoneta-cli verify primary oldest /tmp
```

9.5 archive

Archive a backup from a server

Command

Example

```
pgmoneta-cli archive primary newest current /tmp
```

9.6 delete

Delete a backup from a server

Command

```
pgmoneta-cli delete <server> [<timestamp>|oldest|newest]
```

Example

```
pgmoneta-cli delete primary oldest
```

9.7 retain

Retain a backup from a server. The backup will not be deleted by the retention policy

Command

```
pgmoneta-cli retain <server> [<timestamp>|oldest|newest]
```

Example

```
pgmoneta-cli retain primary oldest
```

9.8 expunge

Expunge a backup from a server. The backup will be deleted by the retention policy

Command

```
pgmoneta-cli expunge <server> [<timestamp>|oldest|newest]
```

Example

```
pgmoneta-cli expunge primary oldest
```

9.9 encrypt

Encrypt the file in place, remove unencrypted file after successful encryption.

Command

```
pgmoneta-cli encrypt <file>
```

9.10 decrypt

Decrypt the file in place, remove encrypted file after successful decryption.

Command

```
pgmoneta-cli decrypt <file>
```

9.11 compress

Compress the file in place, remove uncompressed file after successful compression.

Command

```
pgmoneta-cli compress <file>
```

9.12 decompress

Decompress the file in place, remove compressed file after successful decompression.

Command

```
pgmoneta-cli decompress <file>
```

9.13 info

Information about a backup.

Command

```
pgmoneta-cli info <server> <timestamp|oldest|newest>
```

9.14 ping

Verify if **pgmoneta** is alive

Command

```
pgmoneta-cli ping
```

Example

```
pgmoneta-cli ping
```

9.15 shutdown

Shutdown **pgmoneta**

Command

```
pgmoneta-cli shutdown
```

Example

```
pgmoneta-cli shutdown
```

9.16 status

Status of **pgmoneta**, with a details option

Command

```
pgmoneta-cli status [details]
```

Example

```
pgmoneta-cli status details
```

9.17 conf

Manage the configuration

Command

```
pgmoneta-cli conf [reload]
```

Subcommand

• reload: Reload configuration

Example

```
pgmoneta-cli conf reload
```

9.18 clear

Clear data/statistics

Command

```
pgmoneta-cli clear [prometheus]
```

Subcommand

• prometheus: Reset the Prometheus statistics

Example

```
pgmoneta-cli clear prometheus
```

9.19 Shell completions

There is a minimal shell completion support for pgmoneta-cli.

Please refer to the Install pgmoneta tutorial for detailed information about how to enable and use shell completions.

10 Prometheus metrics

pgmoneta has the following Prometheus metrics.

10.1 pgmoneta_state

The state of pgmoneta

10.2 pgmoneta_version

The version of pgmoneta

Attribute	Description
version	The version of pgmoneta

10.3 pgmoneta_logging_info

The number of INFO logging statements

10.4 pgmoneta_logging_warn

The number of WARN logging statements

10.5 pgmoneta_logging_error

The number of ERROR logging statements

10.6 pgmoneta_logging_fatal

The number of FATAL logging statements

10.7 pgmoneta_retention_days

The retention days of pgmoneta

10.8 pgmoneta_retention_weeks

The retention weeks of pgmoneta

10.9 pgmoneta_retention_months

The retention months of pgmoneta

10.10 pgmoneta_retention_years

The retention years of pgmoneta

10.11 pgmoneta_retention_server

The retention of a server

Attribute	Description
name	The server identifier
parameter	The day, week, month or year

10.12 pgmoneta_compression

The compression used

10.13 pgmoneta_used_space

The disk space used for pgmoneta

10.14 pgmoneta_free_space

The free disk space for pgmoneta

10.15 pgmoneta_total_space

The total disk space for pgmoneta

10.16 pgmoneta_wal_shipping

The disk space used for WAL shipping for a server

Attribute	Description
name	The server identifier

10.17 pgmoneta_wal_shipping_used_space

The disk space used for WAL shipping of a server

Attribute	Description
name	The server identifier

10.18 pgmoneta_wal_shipping_free_space

The free disk space for WAL shipping of a server

Attribute	Description
name	The server identifier

10.19 pgmoneta_wal_shipping_total_space

The total disk space for WAL shipping of a server

Attribute	Description
name	The server identifier

10.20 pgmoneta_workspace

The disk space used for workspace for a server

Attribute	Description
name	The server identifier

10.21 pgmoneta_workspace_free_space

The free disk space for workspace of a server

Attribute	Description
name	The server identifier

10.22 pgmoneta_workspace_total_space

The total disk space for workspace of a server

Attribute	Description
name	The server identifier

10.23 pgmoneta_hot_standby

The disk space used for hot standby for a server

Attribute	Description
name	The server identifier

10.24 pgmoneta_hot_standby_free_space

The free disk space for hot standby of a server

Attribute	Description
name	The server identifier

10.25 pgmoneta_hot_standby_total_space

The total disk space for hot standby of a server

Attribute	Description
name	The server identifier

10.26 pgmoneta_server_timeline

The current timeline a server is on

Attribute	Description
name	The server identifier

10.27 pgmoneta_server_parent_tli

The parent timeline of a timeline on a server

Attribute	Description
name	The server identifier
tli	

10.28 pgmoneta_server_timeline_switchpos

The WAL switch position of a timeline on a server (showed in hex as a parameter)

Attribute	Description
name	The server identifier
tli	
walpos	

10.29 pgmoneta_server_workers

The numbeer of workers for a server

Attribute	Description
name	The server identifier

10.30 pgmoneta_server_valid

Is the server in a valid state

Attribute	Description
name	The server identifier

10.31 pgmoneta_wal_streaming

The WAL streaming status of a server

Attribute	Description
name	The server identifier

10.32 pgmoneta_server_operation_count

The count of client operations of a server

Attribute	Description
name	The server identifier

10.33 pgmoneta_server_failed_operation_count

The count of failed client operations of a server

Attribute	Description
name	The server identifier

10.34 pgmoneta_server_last_operation_time

The time of the latest client operation of a server

Attribute	Description
name	The server identifier

10.35 pgmoneta_server_last_failed_operation_time

The time of the latest failed client operation of a server

Attribute	Description
name	The server identifier

10.36 pgmoneta_server_checksums

Are checksums enabled

Attribute	Description
name	The server identifier

10.37 pgmoneta_server_summarize_wal

Is summarize_wal enabled

Attribute	Description
name	The server identifier

10.38 pgmoneta_extension

The version of pgmoneta extension

Attribute	Description
name	The server identifier
version	The version of the extension

10.39 pgmoneta_backup_oldest

The oldest backup for a server

Attribute	Description
name	The server identifier

10.40 pgmoneta_backup_newest

The newest backup for a server

Attribute	Description
name	The server identifier

10.41 pgmoneta_backup_count

The number of valid backups for a server

Attribute	Description
name	The server identifier

10.42 pgmoneta_backup

Is the backup valid for a server

Attribute	Description
name	The server identifier
label	The backup label

10.43 pgmoneta_backup_version

The version of postgresql for a backup

Attribute	Description
name	The server identifier
label	The backup label
major	The PostgreSQL major version
minor	The PostgreSQL minor version

10.44 pgmoneta_backup_total_elapsed_time

The backup in seconds for a server

Attribute	Description
name	The server identifier
label	The backup label

10.45 pgmoneta_backup_basebackup_elapsed_time

The duration for basebackup in seconds for a server

Attribute	Description
name	The server identifier
label	The backup label

10.46 pgmoneta_backup_manifest_elapsed_time

The duration for manifest in seconds for a server

Attribute	Description
name	The server identifier
label	The backup label

10.47 pgmoneta_backup_compression_zstd_elapsed_time

The duration for zstd compression in seconds for a server

Attribute	Description
name	The server identifier
label	The backup label

10.48 pgmoneta_backup_compression_gzip_elapsed_time

The duration for gzip compression in seconds for a server

Attribute	Description
name	The server identifier
label	The backup label

10.49 pgmoneta_backup_compression_bzip2_elapsed_time

The duration for bzip2 compression in seconds for a server

Attribute	Description
name	The server identifier
label	The backup label

10.50 pgmoneta_backup_compression_lz4_elapsed_time

The duration for Iz4 compression in seconds for a server

Attribute	Description
name	The server identifier
label	The backup label

10.51 pgmoneta_backup_encryption_elapsed_time

The duration for encryption in seconds for a server

Attribute	Description
name	The server identifier
label	The backup label

10.52 pgmoneta_backup_linking_elapsed_time

The duration for linking in seconds for a server

Attribute	Description
name	The server identifier
label	The backup label

10.53 pgmoneta_backup_remote_ssh_elapsed_time

The duration for remote ssh in seconds for a server

Attribute	Description
name	The server identifier
label	The backup label

10.54 pgmoneta_backup_remote_s3_elapsed_time

The duration for remote_s3 in seconds for a server

Attribute	Description
name	The server identifier
label	The backup label

10.55 pgmoneta_backup_remote_azure_elapsed_time

The duration for remote_azure in seconds for a server

Attribute	Description
name	The server identifier
label	The backup label

10.56 pgmoneta_backup_start_timeline

The starting timeline of a backup for a server

Attribute	Description
name	The server identifier
label	The backup label

10.57 pgmoneta_backup_end_timeline

The ending timeline of a backup for a server

Attribute	Description
name	The server identifier
label	The backup label

10.58 pgmoneta_backup_start_walpos

The starting WAL position of a backup for a server

Attribute	Description
name	The server identifier
label	The backup label
walpos	The WAL position

10.59 pgmoneta_backup_checkpoint_walpos

The checkpoint WAL position of a backup for a server

Attribute	Description
name	The server identifier
label	The backup label
walpos	The WAL position

10.60 pgmoneta_backup_end_walpos

The ending WAL position of a backup for a server

Attribute	Description
name	The server identifier
label	The backup label
walpos	The WAL position

10.61 pgmoneta_restore_newest_size

The size of the newest restore for a server

Attribute	Description
name	The server identifier

10.62 pgmoneta_backup_newest_size

The size of the newest backup for a server

Attribute	Description
name	The server identifier

10.63 pgmoneta_restore_size

The size of a restore for a server

Attribute	Description
name	The server identifier
label	The backup label

10.64 pgmoneta_restore_size_increment

The size increment of a restore for a server

Attribute	Description
name	The server identifier
label	The backup label

10.65 pgmoneta_backup_size

The size of a backup for a server

Attribute	Description
name	The server identifier
label	The backup label

10.66 pgmoneta_backup_compression_ratio

The ratio of backup size to restore size for each backup

Attribute	Description
name	The server identifier
label	The backup label

10.67 pgmoneta_backup_throughput

The throughput of the backup for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

10.68 pgmoneta_backup_basebackup_mbs

The throughput of the basebackup for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

10.69 pgmoneta_backup_manifest_mbs

The throughput of the manifest for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

10.70 pgmoneta_backup_compression_zstd_mbs

The throughput of the zstd compression for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

10.71 pgmoneta_backup_compression_gzip_mbs

The throughput of the gzip compression for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

10.72 pgmoneta_backup_compression_bzip2_mbs

The throughput of the bzip2 compression for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

10.73 pgmoneta_backup_compression_lz4_mbs

The throughput of the lz4 compression for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

10.74 pgmoneta_backup_encryption_mbs

The throughput of the encryption for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

10.75 pgmoneta_backup_linking_mbs

The throughput of the linking for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

10.76 pgmoneta_backup_remote_ssh_mbs

The throughput of the remote_ssh for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

10.77 pgmoneta_backup_remote_s3_mbs

The throughput of the remote_s3 for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

10.78 pgmoneta_backup_remote_azure_mbs

The throughput of the remote_azure for a server (MB/s)

Attribute	Description
name	The server identifier
label	The backup label

10.79 pgmoneta_backup_retain

Retain backup for a server

Attribute	Description
name	The server identifier
label	The backup label

10.80 pgmoneta_backup_total_size

The total size of the backups for a server

Attribute	Description
name	The server identifier

10.81 pgmoneta_wal_total_size

The total size of the WAL for a server

Attribute	Description
name	The server identifier

10.82 pgmoneta_total_size

The total size for a server

Attribute	Description
name	The server identifier

10.83 pgmoneta_active_backup

Is there an active backup for a server

Attribute	Description
name	The server identifier

10.84 pgmoneta_active_restore

Is there an active restore for a server

Attribute	Description
name	The server identifier

10.85 pgmoneta_active_archive

Is there an active archiving for a server

Attribute	Description
name	The server identifier

10.86 pgmoneta_active_delete

Is there an active delete for a server

Attribute	Description
name	The server identifier

10.87 pgmoneta_active_retention

Is there an active archiving for a server

Attribute	Description
name	The server identifier

10.88 pgmoneta_current_wal_file

The current streaming WAL filename of a server

Attribute	Description
name	The server identifier

Attribute	Description
file	The WAL file name

10.89 pgmoneta_current_wal_lsn

The current WAL log sequence number

Attribute	Description
name	The server identifier
lsn	The Logical Sequence Number

11 SSH

11.1 Prerequisites

First of all, you need to have a remote server where you can store your backups on.

Lets take an EC2 instance as an example, after launching an EC2 instance you need to add new user account with SSH access to the EC2 instance:

- 1. Connect to your Linux instance using SSH.
- 2. Use the adduser command to add a new user account to an EC2 instance (replace new_user with the new account name).

```
sudo adduser new_user --disabled-password
```

3. Change the security context to the new_user account so that folders and files you create have the correct permissions:

```
sudo su - new_user
```

4. Create a .ssh directory in the new_user home directory and use the chmod command to change the .ssh directory's permissions to 700:

```
mkdir .ssh && chmod 700 .ssh
```

5. Use the touch command to create the authorized_keys file in the .ssh directory and use the chmod command to change the .ssh/authorized_keys file permissions to 600:

```
touch .ssh/authorized_keys && chmod 600 .ssh/authorized_keys
```

6. Retrieve the public key for the key pair in your local computer:

```
cat ~/.ssh/id_rsa.pub
```

7. In the EC2 instance, run the cat command in append mode:

```
cat >> .ssh/authorized_keys
```

- 8. Paste the public key into the .ssh/authorized_keys file and then press Enter.
- 9. Press and hold Ctrl+d to exit cat and return to the command line session prompt.

To verify that the new user can use SSH to connect to the EC2 instance, run the following command from a command line prompt on your local computer:

```
ssh new_user@public_dns_name_of_EC2_instance
```

11.2 Modify the pgmoneta configuration

You need to create a directory on your remote server where backups can be stored in.

In addition, your local computer needs to have a storage space for 1 backup.

Change pgmoneta.conf to add

```
storage_engine = ssh
ssh_hostname = your-public_dns_name_of_EC2_instance
ssh_username = new_user
ssh_base_dir = the-path-of-the-directory-where-backups-stored-in
```

under the [pgmoneta] section.

12 Azure

12.1 Prerequisites

First of all, you need to have an Azure account, an Azure storage account and a blob container.

A container organizes a set of blobs, similar to a directory in a file system. A storage account can include an unlimited number of containers, and a container can store an unlimited number of blobs.

To create an Azure storage account with the Azure portal:

- 1. Sign in to the Azure portal.
- 2. From the left portal menu, select Storage accounts to display a list of your storage accounts. If the portal menu isn't visible, click the menu button to toggle it on.
- 3. On the Storage accounts page, select Create.
- 4. On the Basics tab, provide a resource group name and storage account name. You can go for the default settings of the other fields.
- 5. Choose Next: Advanced.
- 6. On the Advanced tab, you can configure additional options and modify default settings for your new storage account. You can go for the default settings.
- 7. Choose Next: Networking.
- 8. On the Networking tab, you can go for the default settings.
- 9. Choose Next: Data protection.
- 10. On the Data protection tab, you can for the default settings.
- 11. Choose Next: Encryption.
- 12. On the Encryption tab, you can for the default settings.
- 13. Choose Next: Tags.
- 14. Choose Next: Review to see all of the choices you made up to this point. When you are ready to proceed, choose Create.

To create a blob container with the Azure portal:

- 1. In the navigation pane for the storage account, scroll to the Data storage section and select Containers.
- 2. Within the Containers pane, select the + Container button to open the New container pane.

- 3. Within the New Container pane, provide a Name for your new container.
- 4. Select Create to create the container.

To get the Azure storage account shared key which is required for pgmoneta configuration:

- 1. In the navigation pane for the storage account, scroll to the Security + networking section and select Access Keys.
- 2. Under key1, find the Key value. Select the Copy button to copy the account key.

You can use either of the two keys to access Azure Storage, but in general it's a good practice to use the first key, and reserve the use of the second key for when you are rotating keys.

12.2 Modify the pgmoneta configuration

You need to have a storage space for 1 backup on your local computer.

Change pgmoneta.conf to add

```
storage_engine = azure
azure_storage_account = the-storage-account-name
azure_container = the-container-name
azure_shared_key = the-storage-account-shared-key
azure_base_dir = directory-where-backups-will-be-stored-in
```

under the [pgmoneta] section.

13 S3

13.1 Prerequisites

First of all, you need to have an AWS account, an IAM user and S3 bucket.

To create an IAM user:

- 1. Sign in to the AWS Management Console and open the IAM console.
- 2. In the navigation pane, choose Users and then choose Add users.
- 3. Type the user name for the new user.
- 4. Select the type of access to be both programmatic access and access to the AWS Management Console.
- 5. Choose Next: Permissions.
- 6. On the Set permissions page, select attach existing policies directly, search for AmazonS3FullAccess and choose it, then choose Next: Review, then choose Add permissions.
- 7. Choose Next: Tags.
- 8. Choose Next: Review to see all of the choices you made up to this point. When you are ready to proceed, choose Create user.
- 9. To view the users' access keys (access key IDs and secret access keys), choose Show next to each password and access key that you want to see. To save the access keys, choose Download .csv and then save the file to a safe location.

You are now ready to create a S3 bucket, To create a S3 bucket:

- 1. Sign in to the AWS Management Console using your IAM user credentials and open the Amazon S3 console.
- 2. Choose Create bucket.
- 3. In Bucket name, enter a name for your bucket.
- 4. In Region, choose the AWS Region where you want the bucket to reside.
- 5. Keep the default values as it is and Choose Create bucket.

13.2 Modify the pgmoneta configuration

You need to have a storage space for 1 backup on your local computer.

Change pgmoneta.conf to add

```
storage_engine = s3
s3_aws_region = the-aws-region
s3_access_key_id = your-access-key-id-from-the-downloaded-file
s3_secret_access_key = your-secret-access-key-from-the-downloaded-file
s3_bucket = your-s3-bucket-name
s3_base_dir = directory-where-backups-will-be-stored-in
```

under the [pgmoneta] section.

14 Running pgmoneta with Docker

You can run pgmoneta using Docker instead of compiling it manually.

14.1 Prerequisites

- Docker or Podman must be installed on the server where PostgreSQL is running.
- Ensure PostgreSQL is configured to allow external connections.

14.2 Step 1: Enable External PostgreSQL Access

Modify the local PostgreSQL server's postgresql.conf file to allow connections from outside:

```
listen_addresses = '*'
```

Update pg_hba.conf to allow remote connections:

```
host all all 0.0.0.0/0 scram-sha-256
```

Then, restart PostgreSQL for the changes to take effect:

```
sudo systemctl restart postgresql
```

14.3 Step 2: Clone the Repository

```
git clone https://github.com/pgmoneta/pgmoneta.git
cd pgmoneta
```

14.4 Step 3: Build the Docker Image

There are two Dockerfiles available: 1. Alpine-based image

Using Docker sh docker build -t pgmoneta:latest -f ./contrib/docker/Dockerfile.alpine . **Using Podman** sh podman build -t pgmoneta:latest -f ./contrib/docker/Dockerfile.alpine .

2. Rocky Linux 9-based image

```
docker build -t pgmoneta:latest -f ./contrib/docker/Dockerfile.rocky9
```

Using Podman

```
podman build -t pgmoneta:latest -f ./contrib/docker/Dockerfile.rocky9
.
```

14.5 Step 4: Run pgmoneta as a Docker Container

Once the image is built, run the container using: - **Using Docker** sh docker run -d --name pgmoneta --network host pgmoneta:latest-**Using Podman** sh podman run -d --name pgmoneta --network host pgmoneta:latest

14.6 Step 5: Verify the Container

Check if the container is running:

- Using Docker sh docker ps | grep pgmoneta
- Using Podman sh podman ps | grep pgmoneta

Check logs for any errors: - **Using Docker** sh docker logs pgmoneta - **Using Podman** sh podman logs pgmoneta

You can also inspect the exposed server at:

```
http://localhost:5001/
```

15 Troubleshooting

15.1 Could not get version for server

If you get this FATAL during startup check your PostgreSQL logins

```
psql postgres
```

and

```
psql -U repl postgres
```

And, check the PostgreSQL logs for any error.

Setting log_level to DEBUG5 in pgmoneta.conf could provide more information about the error.
